

DS90UB948-Q1 2K FPD-Link III 转 OpenLDI 解串器

1 特性

- 符合汽车应用要求 应用
- 具有符合 AEC Q100 标准的下列结果：
 - 器件温度 2 级：-40℃ 至 +105℃ 的环境运行温度范围
- 支持高达 192 MHz 的像素时钟频率，可实现高达 2K (2048x1080) 的分辨率（24 位色深）
- 具有偏移补偿能力的单通道或双通道 FPD-Link III 接口
- 单通道或双通道 OpenLDI (LVDS) 发送器
 - 单通道：高达 96MHz 的像素时钟
 - 双通道：高达 192MHz 的像素时钟
 - 可配置的 18 位 RGB 或 24 位 RGB
- 四通道高速 GPIO（每个通道最高 2Mbps）
- 自适应接收均衡
 - 1.7GHz 时，通道插入损耗补偿高达 -15.3dB
 - 提供自动温度和电缆老化补偿
- SPI 控制接口速率高达 3.3Mbps
- 具有 1Mbps 快速模式增强版的 I2C（主/从）
- 图像增强功能（白平衡和抖动）
- 支持 7.1 多条 I2S（4 个数据）通道

2 应用

- 汽车信息娱乐：
 - 中央信息显示屏
 - 后座娱乐系统
 - 数字仪表盘

3 说明

DS90UB948-Q1 是一款 FPD-Link III 解串器，与 DS90UB949A/949/947-Q1 串行器配合使用时可将单通道或双通道 FPD-Link III 流转换成 FPD-Link (OpenLDI) 接口格式。该解串器能够在具有成本效益的 50Ω 单端同轴或 100Ω 差分屏蔽双绞线 (STP) 电缆上运行。它能够从单通道或双通道 FPD-Link III 串行流中恢复数据，然后将其转换为双像素 FPD-Link（8 个 LVDS 数据通道 + 时钟），最高可支持 2K (2048x1080) 的视频分辨率（24 位色深）。这可为各个支持 HDMI 的源（例如 CPU）间提供桥接，以便连接到现有 LVDS 显示器或应用处理器。

FPD-Link III 接口支持通过同一条差分链路进行视频和音频数据传输以及全双工控制（包括 I2C 和 SPI 通信）。通过两个差分对实现视频数据和控制的整合可减少互连线尺寸和重量，并简化系统设计。通过使用低压差分信令、数据换序和随机生成最大限度地减少了电磁干扰 (EMI)。在向后兼容模式下，该器件在单一差分链路上最高可支持 WXGA 和 720p 分辨率（24 位色深）。

该器件将自动检测 FPD-Link III 通道并提供一种时钟对齐和偏移补偿功能，无需任何特殊的训练模式。这可在互连线路（例如，PCB 布线）中出现不匹配问题、电缆线对长度存在差异以及连接器不平衡时确保相位偏移在容差范围内。

器件信息⁽¹⁾

器件型号	封装	封装尺寸（标称值）
DS90UB948-Q1	WQFN (64)	9.00mm x 9.00mm

4 修订历史记录

Changes from Revision A (January 2016) to Revision B	Page
• 已更改 支持更高速度 192MHz 的 PCLK 频率。	1
• 已更改 在典型应用中 将 DS90Ux940 解串器顶部的“1.2V”改成了“1.25V”	1
• 删除了电源节点，简化了典型应用。	1
• Removed bolded pin description name for power supplies.	5
• Added new pin description content to the <i>Pin Functions</i> table	5
• Changed the description from VDDIO to V(I2C).	6
• Specified in current instead of resistor for all pulldown resistor	6
• Removed 200-μA minimum ramp time for PDB pin description.	7
• Added the description to clarify the INTB_IN that this pin can be an output driver.....	7
• Changed pin names from CAP_PLL0 and CAP_PLL1 to RES0 and RES1 respectively.	9
• Removed tablenote from the <i>Absolute Maximum Ratings</i> table: For soldering specifications, see product folder at www.ti.com and SNOA549	11
• Added Military/Aerospace tablenote to the <i>Absolute Maximum Ratings</i> table	11
• Changed supply voltage maximum for the VDD33 from: 4 V to: 3.96 V	11
• Changed VDD12 abs max from 1.8V to 1.44V.	11
• Changed supply voltage for the VDDIO from: 4 V to: 3.96 V	11
• Added the Added the open-drain voltage, CML output voltage, and FPD-Link III input voltage parameters to the <i>Absolute Maximum Ratings</i> table , open-drain voltage, CML output voltage, and FPD-Link III input voltage parameters to the <i>Absolute Maximum Ratings</i> table	11
• Added test conditions to the LVCMOS I/O voltage parameter	11
• Spelled out all GPIOs pin name.	11
• Combined the ESD ratings into one <i>ESD Ratings</i> table	11
• Removed VDD18 test condition from the supply voltage parameter	11

修订历史记录 (接下页)

• Added the open-drain voltage parameter to the <i>Recommended Operating Conditions</i> table	11
• Changed open LDI clock frequency (dual link) maximum from: 170 MHz to: 192 MHz	11
• Added the local I2C frequency parameter to the <i>Recommended Operating Conditions</i> table	11
• Added test conditions to the supply noise parameter	12
• Changed the total power consumption, normal operation test conditions	12
• Changed "VDD12 = 1.2 V" to "VDD12 = 1.2 V"	12
• Removed the checkerboard vs. PRBS pattern condition and combined typical and worst case together.	12
• Added current specs for PCLK 192 MHz.	12
• Deleted typical value for Vih and Vil in 3.3V LVCMOS I/O.	12
• Split out the test conditions in the 3.3-V and 1.8-V LVCMOS I/O parameters	12
• Added strap pin input current parameter to the <i>DC Electrical Characteristics</i> table	13
• Deleted typical value for Vih and Vil in 1.8V LVCMOS I/O.	13
• Deleted typical value for Vih and Vil in serial control bus	13
• Added test conditions to the input high level and input low level parameters	13
• Changed "complimentary" to "complementary"	14
• Removed tablenote from the <i>AC Electrical Characteristics</i> table: This parameter is specified by characterization and is not tested in production.	15
• Changed differential output eye height from: >300 mV to: 300 mV	15
• Removed tablenote from the <i>Timing Requirements</i> table: Parameter is specified by bench characterization and is not tested in production.	16
• Changed C _b fast mode plus maximum value from: 550 pF to: 200 pF	16
• Removed tablenote from the <i>Switching Characteristics</i> table: Parameter is specified by bench characterization and is not tested in production.	17
• Changed <i>Deserializer Eye Diagram</i> graph in the <i>Typical Characteristics</i> section	21
• Added paragraph explains HSCC mode.	25
• Changed transmission distance section and insertion loss table.	31
• Changed PCLK frequency from 96 MHz to 192 MHz in the diagram "2-lane FPD-link Input, Link OpenLDI Output" in the <i>Data-Path Configurations</i> graphic	41
• Changed the resistor ratio value for both the <i>Configuration Select (MODE_SEL0)</i> and <i>Configuration Select (MODE_SEL1)</i> tables.	42
• Deleted repeated first paragraph LUT contents.	48
• Changed pullup power supply node from "VDDIO" to "V(I2C)".	51
• Updated register table format to the latest TI standards in the <i>Register Maps</i> section	54
• Changed input value from 1.2 V to 1.2 V in typical application drawings	85
• Updated STP diagram.	86
• Updated Coax diagram.....	87
• Simplified the diagram by removing power supplies node.	88
• Added new design parameters to the <i>Design Requirements</i> section	88
• Changed VDD12 in Design Parameters 1.2 to 1.2	88
• Changed <i>CML Interconnect Guidelines</i> section title to <i>FPD-Link III Interconnect Guidelines</i>	89
• Added <i>AV Mute Prevention</i> section	89
• Added <i>Prevention of I2C Errors During Abrupt System Faults</i> section	90
• Moved the <i>Power Sequence</i> graphic to the <i>Power Supply Recommendations</i>	91
• Removed power supplies columns and changed the parameters in the <i>Power-Up Sequencing Constraints</i> table according to the diagram.	91
• Moved the <i>PCB Layout and Power System Considerations</i> content to the <i>Layout Guidelines</i> section	93
• Added <i>Ground and Routing FPD-Link III Signal Traces</i> sections to the <i>Layout</i> section.....	93

修订历史记录 (接下页)

- 已添加 在 *相关文档* 部分中添加了 FPD-Link 培训视频。 97

Changes from Original (October 2014) to Revision A	Page
• Added shared pins description on SPI pins	6
• Added shared pins description on GPIO pins	7
• Added shared pins description on D_GPIO pins	8
• Added shared pins description on register only GPIO pins. Changed "Local register control only" to "I2C register control only".	8
• Added shared pins description on slave mode I2S pins	8
• Added shared pins description on master mode I2S pins	9
• Added legend for I/O TYPE	10
• Moved Storage Temperature Range from ESD to <i>Absolute Maximum Ratings</i> table	11
• Added ESD Ratings table.....	11
• Changed IDD12Z limit from 8mA to 30mA per PE re-characterization	12
• Changed V _{OS} from 1.0V to 1.125V	14
• Changed V _{OS} from 1.5V to 1.375V	14
• Changed Fast Plus Mode t _{SP} maximum from 20ns to 50ns	16
• Added Image Enhancement Features section	48
• Changed default value from "0" to "1" in register 0x01[2]	56
• Added description to register 0x01[1] "Registers which are loaded by pin strap will be restored to their original strap value when this bit is set. These registers show 'Strap' as their default value in this table."	56
• Added to 0x02[7] in Description column "A Digital reset 0x01[0] should be asserted after toggling Output Enable bit LOW to HIGH"	56
• Added "Loaded from remote SER" in register 0x07[7:1] function column.....	59
• Changed signal detect bit to reserved	65
• Changed from Reserved to Rev-ID in register 0x1D Function column	65
• On register 0x22 added "(Loaded from remote SER)"	69
• Corrected in register 0x24[3] 0: Bist configured through "bit 0" to "bits 2:0" in description	71
• Added in register 0x24[2:1] additional description.....	71
• Changed in register 0x24[1] description to "internal"	71
• Changed in register 0x24[2] description to "internal"	71
• On register 0x28 added "Loaded from remote SER"	72
• Added clarification description on register 0x37 MODE_SEL	75
• Merged on 0x45 bits[7:4] and bits[3:0] default value: 0x08.....	78
• Added Power Sequence section	91

5 Pin Configuration and Functions

Pin Functions

PIN		I/O, TYPE	DESCRIPTION
NAME	NUMBER		
OLDI OUTPUT PINS			
CLK1– CLK1+	37 36	O, LVDS	Clock differential output pins This pair requires an external 100-Ω termination for LVDS. Leave unused pins as No Connect. Do not connect to an external pullup or pulldown. Unused LVDS outputs, terminate with a single external 100-Ω termination at the end of the transmission line.
CLK2– CLK2+	24 23	O, LVDS	

Pin Functions (continued)

PIN		I/O, TYPE	DESCRIPTION
NAME	NUMBER		
D0– D0+	43 42	O, LVDS	Differential data output pins This pair requires an external 100-Ω termination for LVDS. Leave unused pins as No Connect. Do not connect to an external pullup or pulldown. Unused LVDS outputs, terminate with a single external 100-Ω termination at the end of the transmission line.
D1– D1+	41 40	O, LVDS	
D2– D2+	39 38	O, LVDS	
D3– D3+	35 34	O, LVDS	
D4– D4+	30 29	O, LVDS	
D5– D5+	28 27	O, LVDS	
D6– D6+	26 25	O, LVDS	
D7– D7+	22 21	O, LVDS	
FPD-LINK III INTERFACE			
RIN0–	54	I/O	FPD-Link III RX Port 0 pins. The port receives FPD-Link III high-speed forward channel video and control data and transmits back channel control data. It can interface with a compatible FPD-Link III serializer TX through a STP or coaxial cable (see 图 50 and 图 51). It must be AC-coupled per 表 86. Leave unused pins as No Connect. Do not connect to an external pullup or pulldown.
RIN0+	53	I/O	
RIN1–	59	I/O	FPD-Link III RX Port 1 pins. The port receives FPD-Link III high-speed forward channel video and control data and transmits back channel control data. It can interface with a compatible FPD-Link III serializer TX through a STP or coaxial cable (see 图 50 and 图 51). It must be AC-coupled per 表 86. Leave unused pins as No Connect. Do not connect to an external pullup or pulldown.
RIN1+	58	I/O	
CMF	55	I/O	Common mode filter – connect 0.1-μF capacitor to GND
I2C PINS			
I2C_SDA	46	I/O, OD	I2C Data Input / Output Interface pin. See Serial Control Bus . Open drain output; this pin must have an external pullup resistor to V _{I2C} DO NOT FLOAT . Recommend a 2.2 kΩ or 4.7 kΩ pullup to 1.8 V or 3.3 V respectively. See I2C Bus Pullup Resistor Calculation (SLVA689).
I2C_SCL	45	I/O, OD	I2C Data Input / Output Interface pin. See Serial Control Bus . Open drain output; this pin must have an external pullup resistor to V _{I2C} DO NOT FLOAT . Recommend a 2.2 kΩ or 4.7 kΩ pullup to 1.8 V or 3.3 V respectively. See I2C Bus Pullup Resistor Calculation (SLVA689).
IDx	47	I, S	I2C Serial Control Bus Device ID Address Select configuration pin Connect to an external pullup to VDD18 and a pulldown to GND to create a voltage divider. See Table 10 .
SPI PINS			
MOSI (D_GPIO0)	19	I/O, PD	SPI Master Output, Slave Input pin (function programmed through register) It is a multifunction pin (shared with D_GPIO0) with a weak internal pulldown (3μA). Pin function is programmed through registers. If unused, tie to an external pulldown.
MISO (D_GPIO1)	18	I/O, PD	SPI Master Input, Slave Output pin (function programmed through register) It is a multifunction pin (shared with D_GPIO1) with a weak internal pulldown (3μA). Pin function is programmed through registers. If unused, tie to an external pulldown.
SPLK (D_GPIO2)	17	I/O, PD	SPI Clock pin (function programmed through register) It is a multifunction pin (shared with D_GPIO2) with a weak internal pulldown (3μA). Pin function is programmed through registers. If unused, tie to an external pulldown.
SS (D_GPIO3)	16	I/O, PD	SPI Slave Select pin (function programmed through register) It is a multifunction pin (shared with D_GPIO0) with a weak internal pulldown (3μA). Pin function is programmed through registers. If unused, tie to an external pulldown.

Pin Functions (continued)

PIN		I/O, TYPE	DESCRIPTION
NAME	NUMBER		
CONTROL PINS			
MODE_SEL0	61	I, S	Mode Select 0 configuration pin Connect to external pullup to VDD33 and pulldown to GND to create a voltage divider. See Configuration Select (MODE_SEL0) Table 8 .
MODE_SEL1	50	I, S	Mode Select 1 configuration pin Connect to external pullup to VDD33 and pulldown to GND to create a voltage divider. See Configuration Select (MODE_SEL1) Table 9 .
PDB	48	I, PD	Inverted Power-Down input pin Typically connected to a processor GPIO with a pulldown. When PDB input is brought HIGH, the device is enabled and internal registers and state machines are reset to default values. Asserting PDB signal low will power down the device and consume minimum power. The default function of this pin is PDB = LOW; POWER DOWN with an weak (>100-kΩ) internal pulldown enabled. PDB should remain low until after power supplies are applied and reach minimum required levels. PDB = 1, device is enabled (normal operation) PDB = 0, device is powered down When the device is in the POWER DOWN state, the LVCMOS outputs are in tri-state, the PLL is shut down, and IDD is minimized.
BISTEN	5	I, PD	BIST Enable pin 0: BIST mode is disabled 1: BIST mode is enabled It is a configuration pin with a weak internal pulldown (3μA). If unused, tie to an external pulldown. See Built-In Self Test (BIST) for more information.
BISTC (INTB_IN)	4	I, PD	BIST Clock Select pin (function programmed through register) 0: PCLK 1: 33 MHz It is a multifunction pin (shared with INTB_IN) with a weak internal pulldown (3μA). Pin function is programmed through registers. If unused, tie to an external pulldown.
INTB_IN (BISTC)	4	I, PD	Interrupt Input pin (default function). It is a multifunction pin (shared with BISTC) with a weak internal pulldown (3μA). Pin function is programmed through registers. If unused, tie to an external pulldown. The INTB_IN pin may act as an output driver and pull low when PDB is low (see Interrupt Pin — Functional Description and Usage (INTB_IN)).
GPIO PINS			
GPIO0 (SDOUT)	7	I/O	General Purpose Input / Output 0 pin (default function) default state: logic LOW It is a multifunction pin (shared with SDOUT) with a weak internal pulldown (3 μA). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
GPIO1 (SWC)	8	I/O	General Purpose Input / Output 1 pin (default function) default state: logic LOW It is a multifunction pin (shared with SWC) with a weak internal pulldown (3 μA). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
GPIO2 (I2S_DC)	10	I/O	General Purpose Input / Output 2 pin (default function) default state: logic LOW It is a multifunction pin (shared with I2S_DC) with a weak internal pulldown (3 μA). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
GPIO3 (I2S_DD)	9	I/O	General Purpose Input / Output 3 pin (default function) default state: logic LOW It is a multifunction pin (shared with I2C_DD) with a weak internal pulldown (3 μA). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
GPIO9 (MCLK)	15	I/O	General Purpose Input / Output 9 pin (default function) default state: logic LOW It is a multifunction pin (shared with MCLK) with a weak internal pulldown (3 μA). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
HIGH-SPEED GPIO PINS			

Pin Functions (continued)

PIN		I/O, TYPE	DESCRIPTION
NAME	NUMBER		
D_GPIO0 (MOSI)	19	I/O	High-Speed General Purpose Input / Output 0 pin (default function) default state: <i>tri-state</i> Only available in Dual Link Mode. It is a multifunction pin (shared with MOSI) with a weak internal pulldown (3 μ A). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
D_GPIO1 (MISO)	18	I/O	High-Speed General Purpose Input / Output 1 pin (default function) default state: <i>tri-state</i> Only available in Dual Link Mode. It is a multifunction pin (shared with MISO) with a weak internal pulldown (3 μ A). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
D_GPIO2 (SPLK)	17	I/O	High-Speed General Purpose Input / Output 2 pin (default function) default state: <i>tri-state</i> Only available in Dual Link Mode. It is a multifunction pin (shared with SPLK) with a weak internal pulldown (3 μ A). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
D_GPIO3 (SS)	16	I/O	High-Speed General Purpose Input / Output 3 pin (default function) default state: <i>tri-state</i> Only available in Dual Link Mode. It is a multifunction pin (shared with SS) with a weak internal pulldown (3 μ A). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
REGISTER ONLY GPIO PINS			
GPIO5_REG (I2S_DB)	11	I/O	High-Speed General Purpose Input / Output 5 pin (default function) I2C register control only default state: logic <i>LOW</i> It is a multifunction pin (shared with I2S_DB) with a weak internal pulldown (3 μ A). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
GPIO6_REG (I2S_DA)	12	I/O	High-Speed General Purpose Input / Output 6 pin (default function) I2C register control only default state: logic <i>LOW</i> It is a multifunction pin (shared with I2S_DA) with a weak internal pulldown (3 μ A). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
GPIO7_REG (I2S_WC)	14	I/O	High-Speed General Purpose Input / Output 7 pin (default function) I2C register control only default state: logic <i>LOW</i> It is a multifunction pin (shared with I2S_WC) with a weak internal pulldown (3 μ A). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
GPIO8_REG (I2S_CLK)	13	I/O	High-Speed General Purpose Input / Output 8 pin (default function) I2C register control only default state: logic <i>LOW</i> It is a multifunction pin (shared with I2S_CLK) with a weak internal pulldown (3 μ A). Pin function is programmed through registers. See General-Purpose I/O (GPIO) . If unused, tie to an external pulldown.
SLAVE MODE LOCAL I2S CHANNEL PINS			
I2S_WC (GPIO7_REG)	14	O	Slave Mode I2S Word Clock Output pin (function programmed through register) It is a multifunction pin (shared with GPIO7_REG). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.
I2S_CLK (GPIO8_REG)	13	O	Slave Mode I2S Clock Output pin (function programmed through register) NOTE: Disable I2S data jitter cleaner, when using these pins, through the register bit I2S Control: 0x2B[7]=1 It is a multifunction pin (shared with GPIO8_REG). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.
I2S_DA (GPIO6_REG)	12	O	Slave Mode I2S Data Output pin (function programmed through register) It is a multifunction pin (shared with GPIO6_REG). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.
I2S_DB (GPIO5_REG)	11	O	Slave Mode I2S Data Output pin (function programmed through register) It is a multifunction pin (shared with GPIO5_REG). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.

Pin Functions (continued)

PIN		I/O, TYPE	DESCRIPTION
NAME	NUMBER		
I2S_DC (GPIO2)	10	O	Slave Mode I2S Data Output (function programmed through register) It is a multifunction pin (shared with GPIO2). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.
I2S_DD (GPIO3)	9	O	Slave Mode I2S Data Output (function programmed through register) It is a multifunction pin (shared with GPIO3). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.
MASTER MODE LOCAL I2S CHANNEL PINS			
SWC (GPIO1)	8	O	Master Mode I2S Word Clock Output pin (function is programmed through registers) (Pin is shared with GPIO1) It is a multifunction pin (shared with GPIO1). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.
SDOUT (GPIO0)	7	O	Master Mode I2S Data Output pin (function is programmed through registers) (Pin is shared with GPIO0) It is a multifunction pin (shared with GPIO0). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.
MCLK (GPIO9)	15	O	Master Mode I2S System Clock Output pin (function is programmed through registers) (Pin is shared with GPIO9) It is a multifunction pin (shared with GPIO9). Pin function is programmed through registers. See I2S Audio Interface . If unused, tie to an external pulldown.
STATUS PINS			
LOCK	1	O	Lock Status Output pin LOCK = 1: PLL acquired lock to the reference clock input LOCK = 0: PLL is unlocked
PASS	7	O	Normal mode status output pin (BISTEN = 0) PASS = 1: No fault detected on input display timing PASS = 0: Indicates an error condition or corruption in display timing. Fault condition occurs: 1. DE length value mismatch measured once in succession 2. VSync length value mismatch measured twice in succession BIST mode status output pin (BISTEN = 1) PASS = 1: No error detected PASS = 0: Error detected
POWER and GROUND			
VDD33_A, VDD33_B	56 31	P	3.3-V (±10%) supply. Power to on-chip regulator. Requires 10-μF, 1-μF, 0.1-μF, and 0.01-μF capacitors to GND.
VDDIO	3	P	LVC MOS I/O power supply: 1.8 V (±5%) OR 3.3 V (±10%). Requires 10-μF, 1-μF, 0.1-μF, and 0.01-μF capacitors to GND.
VDD12_LVDS VDDP12_LVDS VDDL12_0 VDDL12_1 VDDP12_CH0 VDDR12_CH0 VDDP12_CH1 VDDR12_CH1	20 32 6 44 51 52 60 57	P	1.2-V (±5%) supply. Requires 10-μF, 1-μF, 0.1-μF, and 0.01-μF capacitors to GND at each VDD pin.
CAP_I2S VDD25_CAP	2 33	D	Decoupling capacitor connection for on-chip regulator. Recommend to connect with a 0.1-μF decoupling capacitor to GND.
VSS	DAP	G	DAP is the large metal contact at the bottom side, located at the center of the WQFN package. Connect to the ground plane (GND) with at least 32 vias.
OTHER PINS			
CMLOUTP CMLOUTN	62 63	O	Channel Monitor Loop-through Driver differential output pins Route to a test point or a pad with 100-Ω termination resistor between pins for channel monitoring (recommended). See Figure 47 or Figure 48 .
RES0 RES1	49 64	-	Reserved pins. 0.1-μF decoupling capacitor could be placed to GND. May be left floating as No Connect pins.

The following definitions define the functionality of the I/O cells for each pin.

I/O TYPE:

- P = Power supply
- G = Ground
- D = Decoupling for an internal linear regulator
- S = Configuration/Strap Input (All strap pins have internal pulldowns determined by IOZ specification. If the default strap value is needed to be changed then an external resistor should be used.
- I = Input
- O = Output
- I/O = Input/Output
- PD = Internal pulldown

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT
Supply voltage	VDD33 (VDD33_A, VDD33_B)	−0.3	3.96	V
	VDD12 (VDDL_0, VDDL_1, VDDP12_CH0, VDDR12_CH0, VDDP12_CH1, VDDR12_CH1, VDD12_LVDS, VDDP12_LVDS)	−0.3	1.44	V
	VDDIO	−0.3	3.96	V
Configuration input voltage	IDX, MODE_SEL0, MODE_SEL1	−0.3	3.96	V
LVCMOS I/O voltage	PDB, BIST_EN	−0.3	3.96	V
	GPIO0, GPIO1, GPIO2, GPIO3, D_GPIO0, D_GPIO1, D_GPIO2, D_GPIO3, GPIO5_REG, GPIO6_REG, GPIO7_REG, GPIO8_REG, LOCK, PASS, INTB_IN, MCLK	−0.3	$V_{(VDDIO)} + 0.3$	V
Open-Drain voltage	I2C_SDA, I2C_SCL	−0.3	3.96	V
CML output voltage	CMLOUTP, CMLOUTN	−0.3	2.75	V
FPD-Link III input voltage	RIN0+, RIN0−, RIN1+, RIN1−	−0.3	2.75	V
Junction temperature, T _J			150	°C
Storage temperature range, T _{stg}		−65	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office or Distributors for availability and specifications.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±8000
		Charged-device model (CDM), per AEC Q100-011	±1250
		ESD Ratings (IEC 61000-4-2) R _D = 330 Ω, C _S = 150 pF	±8000
			±15000
		ESD Ratings (ISO10605) R _D = 330 Ω, C _S = 150 and 330 pF R _D = 2 kΩ, C _S = 150 and 330 pF	±8000
			±15000

- AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage	V _(VDD33)	3	3.3	3.6	V
	V _(VDD12)	1.14	1.2	1.26	V
LVCMOS I/O supply voltage	V _(VDDIO) = 3.3 V	3	3.3	3.6	V
	OR V _(VDDIO) = 1.8 V	1.71	1.8	1.89	V
Open-drain voltage	I2C pins = V _(I2C)	1.71		3.6	V
Operating free air temperature, T _A		−40	25	105	°C
Open LDI clock frequency (single link)		25		96	MHz
Open LDI clock frequency (dual link)		50		192	MHz
Local I ² C frequency, f _{I2C}				1	MHz

Recommended Operating Conditions (continued)

Over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply noise ⁽¹⁾	V _(VDD33)			100	mV _{P-P}
	V _(VDDIO) = 3.3 V			100	mV _{P-P}
	V _(VDDIO) = 1.8 V			50	mV _{P-P}
	V _(VDD12)			25	mV _{P-P}

(1) DC to 50 MHz.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DS90UB948-Q1	UNIT
		NKD (WQFN)	
		64 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	24.8	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	6.2	°C/W
R _{θJB}	Junction-to-board thermal resistance	3.6	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.1	°C/W
ψ _{JB}	Junction-to-board characterization parameter	3.6	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.6	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 DC Electrical Characteristics

Over recommended operating supply and temperature ranges unless otherwise specified.

PARAMETER		TEST CONDITIONS	PIN/FREQ.	MIN	TYP	MAX	UNIT
POWER CONSUMPTION							
P _T	Total power consumption, normal operation	PCLK = 170 MHz. 2-lane FPD-Link III input, dual-link OLDI output	VDD	858	1146		mW
P _Z	Total power consumption, power-down mode	PDB = 0 V		40	70		mW
SUPPLY CURRENT							
IDD12	Supply current, normal operation	PCLK = 170 MHz. 2-lane FPD-Link III input, dual-link OLDI output	VDD12 = 1.2 V	169	223		mA

		Normal mode — see Table 3		133		kbps	
t _{GPIO,FC}	GPIO pulse width, forward channel		GPIO[3:0]	> 2 / OLDI Clock		s	
t _{GPIO,BC}	GPIO pulse width, back channel		GPIO[3:0]	20		μs	
RESET							
t _{LRST}	PDB reset low pulse		PDB	2		ms	
LOOP-THROUGH MONITOR OUTPUT							
E _W	Differential output eye opening width	R _L = 100 Ω, jitter frequency >OLDI Clock / 40 See Figure 2	CMLOUTP, CMLOUTN	0.4		UI ⁽¹⁾	
E _H	Differential output eye height			300		mV	
I2S TRANSMITTER							
t _{j,I2S}	Clock output jitter		I2S_CLK	2		ns	
t _{i2S}	I2S clock period ⁽²⁾	See Figure 14		>2 / OLDI Clock or >77		ns	
t _{HC,I2S}	I2S clock high time ⁽²⁾	See Figure 14		0.48		t _{i2S}	
t _{LC,I2S}	I2S clock low time ⁽²⁾	See Figure 14		0.48		t _{i2S}	
t _{SR,I2S}	I2S set-up time	See Figure 14	I2S_DA, I2S_DB, I2S_DC, I2S_DD	0.4		t _{i2S}	
t _{HR,I2S}	I2S hold time	See Figure 14		0.4		t _{i2S}	

(1) UI – Unit Interval is equivalent to one serialized data bit width. For Single Lane mode $1UI = 1 / (35 \times \text{PCLK})$. For Dual Lane mode, $1UI = 1 / (35 \times \text{PCLK} / 2)$. The UI scales with PCLK frequency.

(2) I2S specifications for $t_{LC,I2S}$ and $t_{HC,I2S}$ pulses must each be greater than 1 OLDI clock period to ensure sampling and supersedes the $0.35 \times t_{I2S}$ requirement. $t_{LC,I2S}$ and $t_{HC,I2S}$ must be longer than the greater of either $0.35 \times t_{I2S}$ or $2 \times \text{OLDI Clock}$.

6.7 Timing Requirements for the Serial Control Bus

Over I²C supply and temperature ranges unless otherwise specified.

6.10 Typical Characteristics

7 Detailed Description

7.1 Overview

The DS90UB948-Q1 receives a 35-bit symbol over single or dual serial FPD-Link III pairs operating at up to 3.36 Gbps line rate in 1-lane FPD-Link III mode and 2.975 Gbps per lane in 2-lane FPD-Link III mode. The DS90UB948-Q1 converts this stream into a single or dual FPD-Link Interface (4 LVDS data channels + 1 LVDS clock, or 8 LVDS data channels + 2 LVDS clocks). The FPD-Link III serial stream contains an embedded clock, video control signals, and the DC-balanced video data and audio data which enhance signal quality to support AC coupling.

The DS90UB948-Q1 is intended for use with the DS90UB949-Q1 or DS90UB947-Q1 serializers, but is also backward compatible to the DS90UB925Q-Q1 and DS90UB927Q-Q1 FPD-Link III serializers.

The DS90UB948-Q1 deserializer attains lock to a data stream without the use of a separate reference clock source, which greatly simplifies system complexity and overall cost. The deserializer also synchronizes to the serializer regardless of the data pattern, delivering true automatic *plug and lock* performance. It can lock to the incoming serial stream without the need of special training patterns or sync characters. The deserializer recovers the clock and data by extracting the embedded clock information, validating then deserializing the incoming data stream.

The DS90UB948-Q1 deserializer incorporates an I2C-compatible interface. The I2C-compatible interface allows programming of serializer or deserializer devices from a local host controller. The devices also incorporate a bidirectional control channel (BCC) that allows communication between serializer/deserializer as well as remote I2C slave devices.

The bidirectional control channel (BCC) is implemented through embedded signaling in the high-speed forward channel (serializer to deserializer) combined with lower speed signaling in the reverse channel (deserializer to serializer). Through this interface, the BCC provides a mechanism to bridge I2C transactions across the serial link from one I2C bus to another. The implementation allows for arbitration with other I2C-compatible masters at either side of the serial link.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 High-Speed Forward Channel Data Transfer

The high-speed forward channel is composed of 35 bits of data containing RGB data, sync signals, I2C, GPIOs, and I2S audio transmitted from serializer to deserializer. [Figure 17](#) shows the serial stream per clock cycle. This data payload is optimized for signal transmission over an AC-coupled link. Data is randomized, balanced, and scrambled.

Figure 17. FPD-Link III Serial Stream

The DS90UB948-Q1 supports clocks in the range of 25 MHz to 96 MHz over 1 lane, or 50 MHz to 192 MHz over 2 lanes. The FPD-Link III serial stream rate is 3.36 Gbps maximum (875 Mbps minimum) or 2.975 Gbps maximum per lane (875 Mbps minimum), respectively.

7.3.2 Low-Speed Back Channel Data Transfer

The Low-Speed Backward Channel provides bidirectional communication between the display and host processor. The information is carried from the deserializer to the serializer as serial frames. The back channel control data is transferred over both serial links along with the high-speed forward data, DC balance coding and embedded clock information. This architecture provides a backward path across the serial link together with a high-speed forward channel. The back channel contains the I2C, CRC and 4 bits of standard GPIO information with 5-Mbps or 20-Mbps line rate (configured by MODE_SEL1).

7.3.3 FPD-Link III Port Register Access

Because the DS90UB948-Q1 contains two ports, some registers must be duplicated to allow control and monitoring of the two ports. To facilitate this, PORT1_SEL and PORT0_SEL bits (0x34[1:0]) register controls access to the two sets of registers. Registers that are shared between ports (not duplicated) are available independent of the settings in the PORT_SEL register.

Setting the PORT1_SEL and PORT0_SEL bit allows a read of the register for the selected port. If both bits are set, port1 registers are returned. Writes occur to ports for which the select bit is set, allowing simultaneous writes to both ports if both select bits are set.

7.3.4 Oscillator Output

The deserializer provides an optional CLK[2:1]± output when the input clock (serial stream) has been lost. This is based on an internal oscillator and may be controlled from register 0x02, bit 5 (OSC Clock Output Enable). See [Register Maps](#).

7.3.5 Clock and Output Status

When PDB is driven HIGH, the CDR PLL begins locking to the serial input and LOCK is tri-state or LOW (depending on the value of the OUTPUT ENABLE setting). After the deserializer completes its lock sequence to the input serial data, the LOCK output is driven HIGH, indicating valid data and clock recovered from the serial input is available on the LVCMOS and LVDS outputs. The state of the outputs is based on the OUTPUT ENABLE and OUTPUT SLEEP STATE SELECT register settings. See register 0x02 in [Register Maps](#).

Feature Description (continued)

Table 1. Output State Table

INPUTS				OUTPUTS			
Serial INPUT	PDB	OUTPUT ENABLE Reg 0x02 [7]	OUTPUT SLEEP STATE SELECT Reg 0x02 [4]	LOCK	PASS	Data GPIO / D_GPIO I2S	D[7:0] / CLK[2:1]
X	L	X	X	Z	Z	Z	Z
X	H	L	L	L	L	L	L
X	H	L	H	L or H	Z	Z	Z
Static	H	H	L	L	L	L	L/OSC (Register EN)
Static	H	H	H	L	Previous status	L	L
Active	H	H	L	L	L	L	L
Active	H	H	H	H	Valid	Valid	Valid

7.3.6 LVCMOS VDDIO Option

The 1.8-V or 3.3-V inputs and outputs are powered from a separate VDDIO supply to offer compatibility with external system interface signals.

NOTE

When configuring the VDDIO power supplies, all the single-ended data and control input pins for device must scale together with the same operating VDDIO levels.

7.3.7 Power Down (PDB)

The deserializer has a PDB input pin to ENABLE or POWER DOWN the device. This pin can be controlled by the host or through the VDDIO, where VDDIO = 3 V to 3.6 V or VDD33. To save power, disable the link when the display is not needed (PDB = LOW). When the pin is driven by the host, make sure to release it after VDD33 and VDDIO have reached final levels; no external components are required. This pin is preferred to drive PDB pin through microcontroller where the RC filter is optional. In the case of driven by the VDDIO = 3 V to 3.6 V or VDD33 directly, a 10-kΩ resistor to the VDDIO = 3 V to 3.6 V or VDD33 and a > 10-μF capacitor to the GND, are required (see [Figure 47](#)).

7.3.8 Interrupt Pin — Functional Description and Usage (INTB_IN)

The INTB_IN pin is an active low interrupt input pin. The INTB_IN pin may act as an output driver and pull low when PDB is low. This interrupt signal, when configured, propagates to the paired serializer. Consult the appropriate serializer data sheet for details of how to configure this interrupt functionality.

1. On the serializer, set register 0xC6[5] = 1 and 0xC6[0] = 1
2. Deserializer INTB_IN (pin 4) is set LOW by some downstream device.
3. Serializer pulls INTB pin LOW. The signal is active LOW, so a LOW indicates an interrupt condition.
4. External controller detects INTB = LOW; to determine interrupt source, read ISR register.
5. A read to ISR clears the interrupt at the Serializer, releasing INTB.
6. The external controller typically must then access the remote device to determine downstream interrupt source and clear the interrupt driving the deserializer INTB_IN. This would be when the downstream device releases the INTB_IN (pin 4) on the deserializer. The system is now ready to return to step (2) at next falling edge of INTB_IN.

Feature Description (continued)

7.3.9 General-Purpose I/O (GPIO)

7.3.9.1 GPIO[3:0] and D_GPIO[3:0] Configuration

In normal operation, GPIO[3:0] may be used as GPIOs in either forward channel (outputs) or back channel (inputs) mode. GPIO and D_GPIO modes may be configured from the registers (Table 10). The same registers configure either GPIO or D_GPIO, depending on the status of PORT1_SEL and PORT0_SEL bits (0x34[1:0]). D_GPIO operation requires 2-lane FPD-Link III mode. Consult the appropriate serializer data sheet for details on D_GPIO configuration. Note: if paired with a DS90UB925Q-Q1 serializer, the devices must be configured into 18-bit mode to allow usage of GPIO pins on the serializer. To enable 18-bit mode, set serializer register 0x12[2] = 1. 18-bit mode is auto-loaded into the deserializer from the serializer. See Table 2 for GPIO enable and configuration.

Table 2. GPIO Enable and Configuration

DESCRIPTION	DEVICE	FORWARD CHANNEL	BACK CHANNEL
GPIO3 / D_GPIO3	Serializer	0x0F[3:0] = 0x3	0x0F[3:0] = 0x5
	Deserializer	0x1F[3:0] = 0x5	0x1F[3:0] = 0x3
GPIO2 / D_GPIO2	Serializer	0x0E[7:4] = 0x3	0x0E[7:4] = 0x5
	Deserializer	0x1E[7:4] = 0x5	0x1E[7:4] = 0x3
GPIO1 / D_GPIO1	Serializer	0x0E[3:0] = 0x3	0x0E[3:0] = 0x5
	Deserializer	0x1E[3:0] = 0x5	0x1E[3:0] = 0x3
GPIO0 / D_GPIO0	Serializer	0x0D[3:0] = 0x3	0x0D[3:0] = 0x5
	Deserializer	0x1D[3:0] = 0x5	0x1D[3:0] = 0x3

The input value present on GPIO[3:0] or D_GPIO[3:0] may also be read from register or configured to local output mode (Table 10).

7.3.9.2 Back Channel Configuration

The D_GPIO[3:0] pins can be configured to obtain different sampling rates depending on the mode as well as back channel frequency. The mode is controlled by register 0x43 (Table 10). The back channel frequency can be controlled several ways:

1. Register 0x23[6] sets the divider that controls the back channel frequency based on the internal oscillator. 0x23[6] = 0 sets the divider to 4 and 0x23[6] = 1 sets the divider to 2. As long as BC_HS_CTL (0x23[4]) is set to 0, the back channel frequency is either 5 Mbps or 10 Mbps, based on this bit.
2. Register 0x23[4] enables the high-speed back channel. This can also be pin-strapped through MODE_SEL1 (see Table 3). This bit overrides 0x23[6] and sets the divider for the back channel frequency to 1. Setting this bit to 1 sets the back channel frequency to 20 Mbps.

The back channel frequency has variation of $\pm 20\%$. Note: The back channel frequency must be set to 5 Mbps when paired with a DS90UB925Q-Q1, DS90UB925AQ-Q1, or DS90UB927Q-Q1. See Table 3 for details about configuring the D_GPIOs in various modes.

The HSCC modes replace normal back-channel signaling with dedicated GPIOs or SPI data, allowing greater bandwidth for those functions. The HSCC Modes are enabled by setting the HSCC_MODE field in the HSCC_CONTROL register 0x43[2:0] in the DS90UB948-Q1. The HSCC modes eliminate the normal signaling such as Device ID, Capabilities, and RX Lock detect. It is intended to be turned on after obtaining RX Lock in normal back channel mode. Hence, the serializer properly determines capabilities prior to HSCC mode initiation. HSCC mode prevents loading capabilities, and it should only be enabled after RX Lock is established.

Table 3. Back Channel D_GPIO Effective Frequency

HSCC_MODE (0x43[2:0])	MODE	NUMBER OF D_GPIOs	SAMPLES PER FRAME	D_GPIO EFFECTIVE FREQUENCY ⁽¹⁾ (kHz)			D_GPIOs ALLOWED
				5 Mbps BC ⁽²⁾	10 Mbps BC ⁽³⁾	20 Mbps BC ⁽⁴⁾	
000	Normal	4	1	33	66	133	D_GPIO[3:0]
011	Fast	4	6	200	400	800	D_GPIO[3:0]
010	Fast	2	10	333	666	1333	D_GPIO[1:0]
001	Fast	1	15	500	1000	2000	D_GPIO0

(1) The effective frequency assumes the worst-case back channel frequency (–20%) and a 4×sampling rate.

(2) 5 Mbps corresponds to BC_FREQ_SELECT = 0 & BC_HS_CTL = 0.

(3) 10 Mbps corresponds to BC_FREQ_SELECT = 1 & BC_HS_CTL = 0.

(4) 20 Mbps corresponds to BC_FREQ_SELECT = X & BC_HS_CTL = 1.

7.3.9.3 GPIO Register Configuration

GPIO_REG[8:5] are register-only GPIOs and may be programmed as outputs or read as inputs through local register bits only. Where applicable, these bits are shared with I2S pins and will override I2S input if enabled into GPIO_REG mode. See [Table 4](#) for GPIO enable and configuration.

NOTE

Local GPIO value may be configured and read either through local register access, or remote register access through the low-speed bidirectional control channel. Configuration and state of these pins are not transported from serializer to deserializer as is the case for GPIO[3:0].

Table 4. GPIO_REG and GPIO Local Enable and Configuration

DESCRIPTION	REGISTER CONFIGURATION	FUNCTION
GPIO9	0x1A[3:0] = 0x1	Output, L
	0x1A[3:0] = 0x9	Output, H
	0x1A[3:0] = 0x3	Input, Read: 0x6F[1]
GPIO_REG8	0x21[7:4] = 0x1	Output, L
	0x21[7:4] = 0x9	Output, H
	0x21[7:4] = 0x3	Input, Read: 0x6F[0]
GPIO_REG7	0x21[3:0] = 0x1	Output, L
	0x21[3:0] = 0x9	Output, H
	0x21[3:0] = 0x3	Input, Read: 0x6E[7]
GPIO_REG6	0x20[7:4] = 0x1	Output, L
	0x20[7:4] = 0x9	Output, H
	0x20[7:4] = 0x3	Input, Read: 0x6E[6]
GPIO_REG5	0x20[3:0] = 0x1	Output, L
	0x20[3:0] = 0x9	Output, H
	0x20[3:0] = 0x3	Input, Read: 0x6E[5]
GPIO3	0x1F[3:0] = 0x1	Output, L
	0x1F[3:0] = 0x9	Output, H
	0x1F[3:0] = 0x3	Input, Read: 0x6E[3]
GPIO2	0x1E[7:4] = 0x1	Output, L
	0x1E[7:4] = 0x9	Output, H
	0x1E[7:4] = 0x3	Input, Read: 0x6E[2]
GPIO1	0x1E[3:0] = 0x1	Output, L
	0x1E[3:0] = 0x9	Output, H
	0x1E[3:0] = 0x3	Input, Read: 0x6E[1]
GPIO0	0x1D[3:0] = 0x1	Output, L
	0x1D[3:0] = 0x9	Output, H
	0x1D[3:0] = 0x3	Input, Read: 0x6E[0]

7.3.10 SPI Communication

The SPI control channel uses the secondary link in a 2-lane FPD-Link III implementation. Two possible modes are available: forward channel and reverse channel modes. In forward channel mode, the SPI master is located at the serializer, such that the direction of sending SPI data is in the same direction as the video data. In reverse channel mode, the SPI master is located at the deserializer, such that the direction of sending SPI data is in the opposite direction as the video data.

The SPI control channel can operate in a high-speed mode when writing data, but must operate at lower frequencies when reading data. During SPI reads, data is clocked from the slave to the master on the SPI clock falling edge. Thus, the SPI read must operate with a clock period that is greater than the round trip data latency. On the other hand, for SPI writes, data can be sent at much higher frequencies where the MISO pin can be ignored by the master.

SPI data rates are not symmetrical for the two modes of operation. Data over the forward channel can be sent much faster than data over the reverse channel.

NOTE

SPI cannot be used to access serializer or deserializer registers.

7.3.10.1 SPI Mode Configuration

SPI is configured over I2C using the high-speed control channel configuration (HSCC_CONTROL) register, 0x43 ([Register Maps](#)). HSCC_MODE (0x43[2:0]) must be configured for either high-speed, forward channel SPI mode (110) or high-speed, reverse channel SPI mode (111).

7.3.10.2 Forward Channel SPI Operation

In forward channel SPI operation, the SPI master located at the serializer generates the SPI clock (SPLK), master out / slave in data (MOSI), and active low slave select (SS). The serializer oversamples the SPI signals directly using the video pixel clock. The three sampled values for SPLK, MOSI, and SS are each sent on data bits in the forward channel frame. At the deserializer, the SPI signals are regenerated using the pixel clock. To preserve setup and hold time, the deserializer holds MOSI data while the SPLK signal is high. The deserializer also delays SPLK by one pixel clock relative to the MOSI data, increasing setup by one pixel clock.

SERIALIZER

DESERIALIZER

Figure 18. Forward Channel SPI Write

SERIALIZER

DESERIALIZER

Figure 19. Forward Channel SPI Read

7.3.10.3 Reverse Channel SPI Operation

In reverse channel SPI operation, the deserializer samples the slave select (SS), SPI clock (SCLK) into the internal oscillator clock domain. Upon detection of the active SPI clock edge, the deserializer also samples the SPI data (MOSI). The SPI data samples are stored in a buffer to be passed to the serializer over the back channel. The deserializer sends SPI information in a back channel frame to the serializer. In each back channel frame, the deserializer sends an indication of the SS value. The SS must be inactive (high) for at least one back-channel frame period to ensure propagation to the serializer.

Because data is delivered in separate back channel frames and buffered, the data may be regenerated in bursts. [Figure 20](#) shows an example of the SPI data regeneration when the data arrives in three back channel frames. The first frame delivered the SS active indication, the second frame delivered the first three data bits, and the third frame delivers the additional data bits.

DESERIALIZER

SERIALIZER

Figure 20. Reverse Channel SPI Write

For reverse channel SPI reads, the SPI master must wait for a round-trip response before generating the sampling edge of the SPI clock. This is similar to operation in forward channel mode. Note that at most one data/clock sample is sent per back channel frame.

DESERIALIZER

SERIALIZER

Figure 21. Reverse Channel SPI Read

For both reverse-channel SPI writes and reads, the SPI_SS signal must be deasserted for at least one back-channel frame period.

Table 5. SPI SS Deassertion Requirement

BACK CHANNEL FREQUENCY	DEASSERTION REQUIREMENT
5 Mbps	7.5 μ s
10 Mbps	3.75 μ s
20 Mbps	1.875 μ s

7.3.11 Backward Compatibility

The DS90UB948-Q1 is also backward compatible to the DS90UB925Q-Q1 and DS90UB927Q-Q1 for PCLK frequencies ranging from 25 MHz to 85 MHz. Backward compatibility does not need to be enabled. When paired with a backward-compatible device, the deserializer auto-detects to 1-lane FPD-Link III on the primary channel (RIN0 $\pm$).

7.3.12 Adaptive Equalizer

The FPD-Link III receiver inputs incorporate an adaptive equalizer (AEQ) to compensate for signal degradation from the communications channel and interconnect components. Each RX port signal path continuously monitors cable characteristics for long-term cable aging and temperature changes. The AEQ is primarily intended to adapt and compensate for channel losses over the lifetime of a cable installed in an automobile. The AEQ attempts to optimize the equalization setting of the RX receiver. This adaption includes compensating insertion loss from temperature effects and aging degradation due to bending and flexion. To determine the maximum cable reach, factors that affect signal integrity such as jitter, skew, inter-symbol interference (ISI), crosstalk, and so forth, must also be considered. The equalization configuration programmed in registers 0x35 (AEQ_CTL1) and 0x45 (AEQ_CTL2).

7.3.12.1 Transmission Distance

When designing the transmission channel, consider the total insertion loss of all components in the signal path between a serializer and a deserializer. An example of the transmission channel connects from a FPD-Link serializer (SER) to a deserializer would consist of a serializer PCB, two or more connectors, one or more cables, and a deserializer PCB as shown in [Figure 22](#)

Figure 22. Typical Transmission Channel Components With Coaxial Cables

[Table 6](#) depicts the maximum attenuation using DS90UB948-Q1. The PCLK is the maximum frequency based on the channel attenuation. The attenuation increases with cable length and frequency. The trace length of the PCB has very small contribution to the differential insertion loss of the transmission channel. [Table 6](#) shows the maximum attenuation that the AEQ can compensate for at the given PCLK and resultant Nuyquist frequency.

Table 6. Insertion Loss

PCLK (MHz)	FPD-LINK LINE RATE (Gbps)	NYQUIST FREQUENCY (GHz)	CHANNEL ATTENUATION (dB)	TYP CABLE LENGTH (m)
170	2.97	1.48	-15	10
188	3.29	1.64	-12	7
192	3.36	1.71	-9	5

7.3.12.2 Adaptive Equalizer Algorithm

The AEQ process steps through allowed values of the equalizer controls find a value that allows the Clock Data Recovery (CDR) circuit to maintain valid lock condition. For each EQ setting, the circuit waits for a programmed re-lock time period, then checks results for valid lock. If valid lock is detected, the circuit will stop at the current EQ setting and maintain constant value as long as lock state persists. If the deserializer loses LOCK, the adaptive equalizer will resume the LOCK algorithm and the EQ setting is incremented to the next valid state. Once lock is lost, the circuit will continue searching EQ settings to find a valid setting to reacquire the serial data stream sent by the serializer that remains locked.

7.3.12.3 AEQ Settings

7.3.12.3.1 AEQ Start-Up and Initialization

The AEQ circuit can be restarted at any time by setting the AEQ_RESTART bit in the AEQ_CTL1 register 0x35. Once the deserializer is powered on, the AEQ is continually searching through EQ settings and could be at any setting when signal is supplied from the serializer. If the Rx Port CDR locks to the signal, it may be good enough for low bit errors, but could be not optimized or over-equalized. For a consistent initial EQ setting, TI recommends that the user applies AEQ_RESTART or DIGITAL_RESET0 when the serializer input signal frequency is stable to restart adaption from the minimum EQ gain value.

7.3.12.3.2 AEQ Range

The user can program the AEQ circuit with the minimum AEQ level setting used during the EQ adaption. Using the full AEQ range will provide the most flexible solution, however, if the channel conditions are known and an improved deserializer lock time can be achieved by narrowing the search window for allowable EQ gain settings. For example, in a system use case with a longer cable and multiple interconnects creating a higher channel attenuation, the AEQ would not adapt to the minimum EQ gain settings. In this case, starting the adaptation from a higher AEQ level would improve lock time. The AEQ range is determined by the AEQ_CTL2 register 0x45 where the ADAPTIVE_EQ_FLOOR_VALUE determines the starting value for EQ gain adaption. The maximum AEQ limit is not adjustable. To enable the minimum AEQ limit, OVERRIDE_AEQ_FLOOR and SET_AEQ_FLOOR bits in the AEQ_CTL1 register must also be set. The setting for the AEQ after adaption can be readback from the AEQ_STATUS register 0x3B.

7.3.12.3.3 AEQ Timing

The dwell time for AEQ to wait for either the lock or error-free status is also programmable. When checking each EQ setting, the AEQ will wait for a time interval, controlled by the ADAPTIVE_EQ_RELOCK_TIME field in the AEQ_CTL2 register (see [Register Maps](#)) before incrementing to the next allowable EQ gain setting. The default wait time is set to 2.62 ms. Once the maximum setting is reached, if there is no lock acquired during the programmed relock time, the AEQ will restart adaption at the minimum setting or AEQ_FLOOR value.

7.3.13 I2S Audio Interface

This deserializer features six I2S output pins that, when paired with a compatible serializer, support surround-sound audio applications. The bit clock (I2S_CLK) supports frequencies between 1 MHz and the smaller of < PCLK/2 or < 13 MHz. Four I2S data outputs carry two channels of I2S-formatted digital audio each, with each channel delineated by the word select (I2S_WC) input.

Figure 23. I2S Connection Diagram

Figure 24. I2S Frame Timing Diagram

When paired with a DS90UB925Q, the deserializer I2S interface supports a single I2S data output through I2S_DA (24-bit video mode) or two I2S data outputs through I2S_DA and I2S_DB (18-bit video mode).

7.3.13.1 I2S Transport Modes

By default, packetized audio is received during video blanking periods in dedicated data island transport frames. The transport mode is set in the serializer and auto-loaded into the deserializer by default. The audio configuration may be disabled from control registers if forward channel frame transport of I2S data is desired. In frame transport, only I2S_DA is received to the deserializer. Surround sound mode, which transmits all four I2S data inputs (I2S_D[D:A]), may only be operated in data island transport mode. This mode is only available when connected to a DS90UB927Q, DS90UB949-Q1, DS90UB947-Q1, or DS90UB929-Q1 serializer. If connected to a DS90UB925Q serializer, only I2S_DA and I2S_DB may be received.

7.3.13.2 I2S Repeater

I2S audio may be fanned-out and propagated in the repeater application. By default, data is propagated via data island transport on the FPD-Link interface during the video blanking periods. If frame transport is desired, connect the I2S pins from the deserializer to all serializers. Activating surround sound at the top-level serializer automatically configures downstream serializers and deserializers for surround-sound transport utilizing data island transport. If 4-channel operation utilizing I2S_DA and I2S_DB only is desired, this mode must be explicitly set in each serializer and deserializer control register throughout the repeater tree ([Register Maps](#)).

A DS90UB948-Q1 deserializer configured in repeater mode may also regenerate I2S audio from its I2S input pins in lieu of data island frames. See [Figure 27](#) and the I2C Control Registers ([Register Maps](#)) for additional details.

7.3.13.3 I2S Jitter Cleaning

This device features a standalone PLL to clean the I2S data jitter, supporting high-end car audio systems. If I2S_CLK frequency is less than 1MHz, this feature must be disabled through register 0x2B[7]. See the section.

7.3.13.4 MCLK

The deserializer has an I2S Master Clock Output (MCLK). It supports x1, x2, or x4 of I2S CLK Frequency. When the I2S PLL is disabled, the MCLK output is off. [Table 7](#) covers the range of I2S sample rates and MCLK frequencies. By default, all the MCLK output frequencies are x2 of the I2S CLK frequencies. The MCLK frequencies can also be enabled through the register bits 0x3A[6:4] (I2S_DIVSEL), shown in . To select desired MCLK frequency, write 0x3A[7], then write to bit [6:4] accordingly.

Table 7. Audio Interface Frequencies

SAMPLE RATE (kHz)	I2S DATA WORD SIZE (BITS)	I2S CLK (MHz)	MCLK OUTPUT (MHz)	REGISTER 0x3A[6:4]'b
32	16	1.024	I2S_CLK x1	000
			I2S_CLK x2	001
			I2S_CLK x4	010
44.1		1.4112	I2S_CLK x1	000
			I2S_CLK x2	001
			I2S_CLK x4	010
48		1.536	I2S_CLK x1	000
			I2S_CLK x2	001
			I2S_CLK x4	010
96		3.072	I2S_CLK x1	001
			I2S_CLK x2	010
			I2S_CLK x4	011
192		6.144	I2S_CLK x1	010
			I2S_CLK x2	011
			I2S_CLK x4	100
32	24	1.536	I2S_CLK x1	000
			I2S_CLK x2	001
			I2S_CLK x4	010
44.1		2.117	I2S_CLK x1	001
			I2S_CLK x2	010
			I2S_CLK x4	011

			I2S_CLK x2	100
			I2S_CLK x4	101
32	32	2.048	I2S_CLK x1	001
			I2S_CLK x2	010
			I2S_CLK x4	011
44.1		2.8224	I2S_CLK x1	001
			I2S_CLK x2	010
			I2S_CLK x4	011
48		3.072	I2S_CLK x1	001
			I2S_CLK x2	010
			I2S_CLK x4	011
96		6.144	I2S_CLK x1	010
			I2S_CLK x2	011
			I2S_CLK x4	100
192		12.288	I2S_CLK x1	011
			I2S_CLK x2	100
			I2S_CLK x4	110

7.3.14 Repeater

The supported repeater application provides a mechanism to extend transmission over multiple links to multiple display devices.

7.3.14.1 Repeater Configuration

In the repeater application, this document refers to the DS90UB947-Q1 serializer or as the transmitter (TX), and refers to the DS90UB948-Q1 as the Receiver (RX). [Figure 25](#) shows the maximum configuration supported for repeater implementations. Two levels of repeaters are supported with a maximum of three transmitters per receiver.

Figure 25. Maximum Repeater Application

In a repeater application, the I2C interface at each TX and RX is configured to transparently pass I2C communications upstream or downstream to any I2C device within the system. This includes a mechanism for assigning alternate IDs (Slave Aliases) to downstream devices in the case of duplicate addresses.

Copyright © 2016, Texas Instruments Incorporated

Figure 26. 1:2 Repeater Configuration

7.3.14.2 Repeater Connections

The repeater requires the following connections between the receiver and each transmitter [Figure 27](#).

1. Video data – Connect all FPD-Link data and clock pairs. Single FPD-Link (D[3:0]) or Dual FPD-Link (D[7:0]) are both possible, provided the deserializer and all serializers are configured in the same mode.
2. I2C – Connect SCL and SDA signals. Both signals must be pulled up to VDD33 or VDDIO = 3 V to 3.6 V with 4.7-k Ω resistors.
3. Audio (optional) – Connect I2S_CLK, I2S_WC, and I2S_Dx signals. Audio is normally transported on the FPD-Link interface.
4. IDx pin – Each transmitter and receiver must have a unique I2C address.
5. REPEAT & MODE_SEL pins — All transmitters and receivers must be set into repeater mode.
6. Interrupt pin – Connect DS90UB948-Q1 INTB_IN pin to the DS90UB947-Q1 INTB pin. The signal must be pulled up to VDDIO with a 10-k Ω resistor.

Figure 27. Repeater Connection Diagram

7.3.14.2.1 Repeater Fan-Out Electrical Requirements

Repeater applications requiring fan-out from one DS90UB948-Q1 deserializer to up to three DS90UB947-Q1 serializers requires special considerations for routing and termination of the FPD-Link differential traces. [Figure 28](#) details the requirements that must be met for each signal pair:

Figure 28. FPD-Link Fan-Out Electrical Requirements

7.3.15 Built-In Self Test (BIST)

An optional at-speed built-in self test (BIST) feature supports testing of the high-speed serial link and the low-speed back channel without external data connections. This is useful in the prototype stage, equipment production, in-system test, and system diagnostics.

7.3.15.1 BIST Configuration and Status

The BIST mode is enabled at the deserializer by pin (BISTEN) or BIST configuration register. The test may select either an external PCLK or the 33-MHz internal oscillator clock (OSC) frequency in the serializer. In the absence of PCLK, the user can select the internal OSC frequency at the deserializer through the BISTC pin or BIST configuration register.

When BIST is activated at the deserializer, a BIST enable signal is sent to the serializer through the back channel. The serializer outputs a test pattern and drives the link at speed. The deserializer detects the test pattern and monitors it for errors. The deserializer PASS output pin toggles to flag each frame received containing one or more errors. The serializer also tracks errors indicated by the CRC fields in each back channel frame.

The BIST status can be monitored real time on the deserializer PASS pin, with each detected error resulting in a half pixel clock period toggled LOW. After BIST is deactivated, the result of the last test is held on the PASS output until reset (new BIST test or power down). A high on PASS indicates NO ERRORS were detected. A Low on PASS indicates one or more errors were detected. The duration of the test is controlled by the pulse width applied to the deserializer BISTEN pin. LOCK status is valid throughout the entire duration of BIST.

See [Figure 29](#) for the BIST mode flow diagram.

7.3.15.1.1 Sample BIST Sequence

Note: Before BIST can be enabled, D_GPIO0 (pin 19) must be strapped HIGH and D_GPIO[3:1] (pins 16, 17, and 18) must be strapped LOW.

1. BIST Mode is enabled through the BISTEN pin of deserializer. The desired clock source is selected through the deserializer BISTC pin.
2. The serializer is awakened through the back channel if it is not already on. An all-zeros pattern is balanced, scrambled, randomized, and sent through the FPD-Link III interface to the deserializer. Once the serializer and the deserializer are in BIST mode and the deserializer acquires LOCK, the PASS pin of the deserializer goes high and BIST starts checking the data stream. If an error in the payload (1 to 35) is detected, the PASS pin switches low for one half of the clock period. During the BIST test, the PASS output can be monitored and counted to determine the payload error rate per 35 bits.
3. To stop BIST mode, set the BISTEN pin LOW. The deserializer stops checking the data, and the final test result is held on the PASS pin. If the test ran error-free, the PASS output remains HIGH. If there one or more errors were detected, the PASS output outputs constant LOW. The PASS output state is held until a new BIST is run, the device is RESET, or the device is powered down. BIST duration is user-controlled and may be of any length.

The link returns to normal operation after the deserializer BISTEN pin is low. [Figure 30](#) shows the waveform diagram of a typical BIST test for two cases. Case 1 is error-free, and Case 2 shows one with multiple errors. In most cases, it is difficult to generate errors due to the robustness of the link (differential data transmission, and so forth). Errors may be introduced by greatly extending the cable length, faulting the interconnect medium, or reducing signal condition enhancements (Rx equalization).

Figure 29. BIST Mode Flow Diagram

7.3.15.2 Forward Channel and Back Channel Error Checking

The deserializer, on locking to the serial stream, compares the recovered serial stream with all-zeroes and records any errors in status registers. Errors are also dynamically reported on the PASS pin of the deserializer. Forward channel errors may also be read from register 0x25 ([Register Maps](#)).

The back-channel data is checked for CRC errors once the serializer locks onto the back-channel serial stream, as indicated by link detect status (register bit 0x0C[0] - [Register Maps](#)). CRC errors are recorded in an 8-bit register in the serializer. The register is cleared when the serializer enters the BIST mode. As soon as the serializer enters BIST mode, the functional mode CRC register starts recording any back channel CRC errors. The BIST mode CRC error register is active in BIST mode only and keeps the record of the last BIST run until either the error is cleared or the serializer enters BIST mode again.

Figure 30. BIST Waveforms

7.3.16 Internal Pattern Generation

The deserializer supports the internal pattern generation feature. It allows basic testing and debugging of an integrated panel. The test patterns are simple and repetitive and allow for a quick visual verification of panel operation. As long as the device is not in power down mode, the test pattern is displayed even if no parallel input is applied. If no PCLK is received, the test pattern can be configured to use a programmed oscillator frequency. For detailed information, refer to [Exploring the Internal Test Pattern Generation Feature of 720p FPD-Link III Devices](#) (SNLA132).

7.4 Device Functional Modes

7.4.1 Configuration Select MODE_SEL[1:0]

The DS90UB948-Q1 can be configured for several different operating modes via the MODE_SEL[1:0] input pins, or via the register bits 0x23 [4:2] (MODE_SEL1) and 0x49 (MODE_SEL0).

The DS90UB948-Q1 is capable of operating in either in 1-lane or 2-lane mode for FPD-Link III. By default, the FPD-Link III receiver automatically configures the input based on 1- or 2-lane mode operation. Programming register 0x34 [4:3] settings will override the automatic detection. For each FPD-Link III pair, the serial datastream is composed of a 35-bit symbol.

The DS90UB948-Q1 recovers the FPD-Link III serial datastream(s) and produces video data driven to the OpenLDI (LVDS) interface. OpenLDI single link and dual link are supported with color depths of 18 bits per pixel or 24 bits per pixel. There are 8 differential data pairs (D0 through D7) and two clock pairs (CLK1 and CLK2) on the OpenLDI interface. The number of data lines may vary, depending on the pixel formats supported. For single-link output the pixel clock is limited to 96 MHz. In the case of dual link, the pixel clock is limited to 192 MHz (or 96 MHz per LVDS port). When in a dual-link configuration, LVDS channels D0 to D3 carry ODD pixel data, and LVDS channels D4 to D7 carry EVEN pixel data.

The device can be configured in following modes:

- 1-lane FPD-Link III input, single-link OpenLDI output
- 1-lane FPD-Link III Input, Dual Link OpenLDI output
- 2-lane FPD-Link III Input, dual-link OpenLDI output
- 2-lane FPD-Link III Input, single-link OpenLDI output
- 2-lane FPD-Link III Input, single-link OpenLDI output (replicate)

7.4.1.1 1-Lane FPD-Link III Input, Single Link OpenLDI Output

In this configuration the PCLK rate embedded within the 1-lane FPD-Link III frame can range from 25 MHz to 96 MHz, resulting in a link rate of 875 Mbps (35 bit × 25 MHz) to 3.36 Gbps (35 bit × 96 MHz). Each LVDS data lane operates at a speed of 7 bits per LVDS clock cycle; resulting in a serial line rate of 175 Mbps to 672 Mbps. CLK1 operates at the same rate as PCLK with a duty cycle ratio of 57:43.

7.4.1.2 1-Lane FPD-Link III Input, Dual Link OpenLDI Output

The input RGB data is split into odd and even pixels starting with the ODD (first) pixel outputs D0 to D3 and then the EVEN (second) pixel outputs D4 to D7. The splitting of the data signals starts with DE (data enable) transitioning from logic LOW to HIGH indicating active data.

In this configuration the PCLK rate embedded within the 1-lane FPD-Link III frame can range from 50 MHz to 96 MHz, resulting in a link rate of 1.75 Gbps (35 bit × 50 MHz) to 3.36 Gbps (35 bit × 96 MHz). Each LVDS data lane operates at a speed of 7 bits per 2 LVDS clock cycles, resulting in a serial line rate of 175 Mbps to 336 Mbps. CLK1 and CLK2 operate at half the rate as PCLK with a duty cycle ratio of 57:43.

7.4.1.3 2-Lane FPD-Link III Input, Dual Link OpenLDI Output

The input RGB data is split into odd and even pixels starting with the ODD (first) pixel outputs D0 to D3 and then the EVEN (second) pixel outputs D4 to D7. The splitting of the data signals starts with DE (data enable) transitioning from logic LOW to HIGH indicating active data.

In this configuration the PCLK rate embedded within 2-lane FPD-Link III frame can range from 50 MHz to 192 MHz, resulting in a link rate of 875 Mbps (35 bit × 25 MHz) to 3.36 Gbps (35 bit × 96 MHz). Each LVDS data lane will operate at a speed of 7 bits per 2 LVDS clock cycles, resulting in a serial line rate of 175 Mbps to 672 Mbps. CLK1 and CLK2 operate at half the rate as PCLK with a duty cycle ratio of 57:43.

7.4.1.4 2-Lane FPD-Link III Input, Single Link OpenLDI Output

In this configuration the PCLK rate embedded within 2-lane FPD-Link III frame can range from 50 MHz to 192 MHz, resulting in a link rate of 875 Mbps (35 bit × 25 MHz) to 3.36 Gbps (35 bit × 96 MHz). Each LVDS data lane will operate at a speed of 7 bits per LVDS clock cycle; resulting in a serial line rate of 350 Mbps to 1344 Mbps. CLK1 operates at the twice the rate as PCLK with a duty cycle ratio of 57:43.

Device Functional Modes (continued)

7.4.1.5 1-Lane FPD-Link III Input, Single Link OpenLDI Output (Replicate)

Same as 1-lane FPD-Link III input, single-link OpenLDI output mode, and duplicates the LVDS signal on D4 to D7 outputs.

7.4.2 MODE_SEL[1:0]

Possible configurations are shown in Figure 31. These are described above ([Configuration Select MODE_SEL\[1:0\]](#)).

7.4.3 OpenLDI Output Frame and Color Bit Mapping Select

The DS90UB948-Q1 can be configured to output 24-bit color (RGB888) or 18-bit color (RGB666) with 2 different mapping schemes, shown in [Figure 33](#) and [Figure 34](#). Each frame corresponds to a single pixel clock (PCLK) cycle. The LVDS clock output from CLK1± and CLK2± follows a 4:3 duty cycle scheme, with each 28-bit pixel frame starting with two LVDS bit clock periods high, three low, and ending with two high. The mapping scheme is controlled by MODE_SEL0 pin or by Register ([Register Maps](#)).

7.5 Image Enhancement Features

Several image enhancement features are provided. The white-balance LUTs allow the user to define and map the color profile of the display. Adaptive Hi-FRC dithering enables the presentation of 'true color' images on an 18-bit display.

7.5.1 White Balance

The white-balance feature enables similar display appearance when using LCD's from different vendors. It compensates for native color temperature of the display, and adjusts relative intensities of R, G, and B to maintain specified color temperature. Programmable control registers are used to define the contents of three LUTs (8-bit color value for Red, Green and Blue) for the white-balance feature. The LUTs map input RGB values to new output RGB values. There are three LUTs, one LUT for each color. Each LUT contains 256 entries, 8-bits per entry with a total size of 6144 bits ($3 \times 256 \times 8$). All entries are readable and writable. Calibrated values are loaded into registers through the I2C interface (deserializer is a slave device). This feature may also be applied to lower color depth applications such as 18-bit (666) and 16-bit (565). White balance is enabled and configured via serial control bus register.

7.5.2 LUT Contents

The user must define and load the contents of the LUT for each color (R,G,B). Regardless of the color depth being driven (888, 666, 656), the user must always provide contents for 3 complete LUTs: 256 colors $\times$ 8 bits $\times$ 3 tables. Unused bits – LSBs – shall be set to 0 by the user. When 24-bit (888) input data is being driven to a 24-bit display, each LUT (R, G and B) must contain 256 unique 8-bit entries. The 8-bit white balanced data is then available at the output of the deserializer, and driven to the display.

Alternatively, with 6-bit input data the user may choose to load complete 8-bit values into each LUT. This mode of operation provides the user with finer resolution at the LUT output to more closely achieve the desired white point of the calibrated display. Although 8-bit data is loaded, only 64 unique 8-bit white balance output values are available for each color (R, G and B). The result is 8-bit white balanced data. Before driving to the output of the deserializer, the 8-bit data must be reduced to 6-bit with an FRC dithering function. To operate in this mode, the user must configure the deserializer to enable the FRC2 function.

Examples of the three types of LUT configurations described are shown in [Figure 41](#).

7.5.3 Enabling White Balance

The user must load all 3 LUTs prior to enabling the white balance feature. The following sequence must be followed by the user.

Image Enhancement Features (continued)

To initialize white balance after power-on:

1. Load contents of all 3 LUTs. This requires a sequential loading of LUTs - first RED, second GREEN, third BLUE. 256, 8-bit entries must be loaded to each LUT. Page registers must be set to select each LUT.
2. Enable white balance. By default, the LUT data may not be reloaded after initialization at power-on.

An option does exist to allow LUT reloading after power-on and initial LUT loading (as previously described). This option may only be used after enabling the white-balance reload feature via the associated serial control bus register. In this mode the LUTs may be reloaded by the master controller via I2C. This provides the user with the flexibility to refresh LUTs periodically, or upon system requirements, to change to a new set of LUT values. The host controller loads the updated LUT values via the serial bus interface. There is no need to disable the white balance feature while reloading the LUT data. Refreshing the white balance to the new set of LUT data is seamless — no interruption of displayed data.

Note that initial loading of LUT values requires that all 3 LUTs be loaded sequentially. When reloading, partial LUT updates may be made; the LUT cannot be read.

8-bit in / 8 bit out		6-bit in / 6 bit out		6-bit in / 8 bit out

7.5.4 Adaptive Hi-FRC Dithering

The adaptive frame rate control FRC dithering feature delivers product-differentiating image quality. It reduces 24-bit RGB (8 bits per sub-pixel) to 18-bit RGB (6 bits per sub-pixel), smoothing color gradients, and allowing the flexibility to use lower cost 18-bit displays. FRC dithering is a method to emulate *missing* colors on a lower color depth LCD display by changing the pixel color slightly with every frame. FRC is achieved by controlling on and off pixels over multiple frames (temporal). Static dithering regulates the number of on and off pixels in a small defined pixel group (spatial). The FRC module includes both temporal and spatial methods and also Hi-FRC. Conventional FRC can display only 16,194,277 colors with 6-bit RGB source. Hi-FRC enables full (16,777,216) color on an 18-bit LCD panel. The *adaptive* FRC module also includes input pixel detection to apply specific Spatial dithering methods for smoother gray level transitions. When enabled, the lower LSBs of each RGB output are not active; only 18-bit data (6 bits per R,G and B) are driven to the display. This feature is enabled via serial control bus register. Two FRC functional blocks are available, and may be independently enabled. FRC1 precedes the white-balance LUT, and is intended to be used when 24-bit data is being driven to an 18-bit display with a white-balance LUT that is calibrated for an 18-bit data source. The second FRC block, RC2, follows the white balance block and is intended to be used when fine adjustment of color temperature is required on an 18-bit color display, or when a 24-bit source drives an 18-bit display with a white-balance LUT calibrated for 24-bit source data.

Image Enhancement Features (continued)

For proper operation of the FRC dithering feature, the user must provide a description of the display timing control signals. The timing mode, sync mode (HS, VS) or *DE only* must be specified, along with the active polarity of the timing control signals. All this information is entered to device control registers via the serial bus interface.

Adaptive Hi-FRC dithering consists of several components. Initially, the incoming 8-bit data is expanded to 9-bit data. This allows the effective dithered result to support a total of 16.7 million colors. The incoming 9-bit data is evaluated, and one of four possible algorithms is selected. The majority of incoming data sequences are supported by the default dithering algorithm. Certain incoming data patterns (black/white pixel, full on/off sub-pixel) require special algorithms designed to eliminate visual artifacts associated with these specific gray level transitions. Three algorithms are defined to support these critical transitions.

An example of the default dithering algorithm is shown in [Figure 42](#). The 1 or 0 value shown in [Figure 42](#)

[Figure 42](#) describes whether the 6-bit value is increased by 1 (“1”) or left unchanged (“0”). In this case, the 3 truncated LSBs are 001.

F0L0	Frame = 0, Line = 0							
PD1	Pixel Data one

Figure 42. Default FRC Algorithm

7.6 Programming

7.6.1 Serial Control Bus

The device may also be configured by the use of a I2C-compatible serial control bus. Multiple devices may share the serial control bus (up to eight device addresses supported). The device address is set through a resistor divider (R_{HIGH} and R_{LOW} — see Figure 43 below) connected to the IDx pin.

Figure 43. Serial Control Bus Connection

The serial control bus consists of two signals, SCL and SDA. SCL is a serial bus clock input. SDA is the serial bus data input / output signal. Both SCL and SDA signals require an external pullup resistor to 1.8-V or 3.3-V V_{I2C} . For most applications, TI recommends that the user adds a 4.7-k Ω pullup resistor to the VDD33 or 2.2 k Ω resistor to the VDD18. However, the pullup resistor value may be adjusted for capacitive loading and data rate requirements. The signals are either pulled high or driven low. For more details information on how to calculate the pullup resistor, see [I2C Bus Pullup Resistor Calculation](#) (SLVA689).

The IDx pin configures the control interface to one of eight possible device addresses. A pullup resistor and a pulldown resistor may be used to set the appropriate voltage ratio between the IDx input pin (V_{LOW}) and VDD33, each ratio corresponding to a specific device address. See [Table 10](#) for more information.

Table 10. Serial Control Bus Addresses for IDx

NO.	V_{IDx} VOLTAGE	V_{IDx} TARGET VOLTAGE	SUGGESTED STRAP RESISTORS (1% tolerance)		PRIMARY ASSIGNED I ² C ADDRESS	
	V (TYP)	VDD = 3.3 V	R_1 (k Ω)	R_2 (k Ω)	7-BIT	8-BIT
0	0	0	Open	10	0x2C	0x58
1	$0.169 \times V_{(VDD33)}$	0.559	73.2	15	0x2E	0x5C
2	$0.230 \times V_{(VDD33)}$	0.757	66.5	20	0x30	0x60
3	$0.295 \times V_{(VDD33)}$	0.974	59	24.9	0x32	0x64
4	$0.376 \times V_{(VDD33)}$	1.241	49.9	30.1	0x34	0x68
5	$0.466 \times V_{(VDD33)}$	1.538	46.4	40.2	0x36	0x6C
6	$0.556 \times V_{(VDD33)}$	1.835	40.2	49.9	0x38	0x70
7	$0.801 \times V_{(VDD33)}$	2.642	18.7	75	0x3C	0x78

The serial bus protocol is controlled by START, START-Repeated, and STOP phases. A START occurs when SDA transitions low while SCL is high. A STOP occurs when SCL transitions high while SDA is also HIGH. See Figure 44.

Figure 44. START and STOP Conditions

To communicate with a remote device, the host controller (master) sends the slave address and listens for a response from the slave. This response is referred to as an acknowledge bit (ACK). If a slave on the bus is addressed correctly, it acknowledges (ACKs) the master by driving the SDA bus low. If the address does not match the slave address of a device, the slave not-acknowledges (NACKs) the master by letting the SDA be pulled High. ACKs also occur on the bus when data is transmitted. When the master writes data, the slave sends an ACK after every data byte is successfully received. When the master reads data, the master sends an ACK after every data byte is received to let the slave know that the master is ready to receive another data byte. When the master wants to stop reading, the master sends a NACK after the last data byte to create a stop condition on the bus. All communication on the bus begins with either a start condition or a repeated Start condition. All communication on the bus ends with a stop condition. A READ is shown in Figure 45 and a WRITE is shown in Figure 46.

Figure 45. Serial Control Bus — READ

Figure 46. Serial Control Bus — WRITE

The I2C master located in the deserializer must support I2C clock stretching. For more information on I2C interface requirements and throughput considerations, refer to the [I2C Communication Over FPD-Link III with Bidirectional Control Channel](#) (SNLA131).

7.6.2 Multi-Master Arbitration Support

The bidirectional control channel in the FPD-Link III devices implements I2C-compatible bus arbitration in the proxy I2C master implementation. When sending a data bit, each I2C master senses the value on the SDA line. If the master sends a logic 1 but senses a logic 0, the master loses arbitration. The master will stop driving SDA and retry the transaction when the bus becomes idle. Thus, multiple I2C masters may be implemented in the system.

For example, there might also be a local I2C master at each camera. The local I2C master could access the image sensor and EEPROM. The only restriction would be that the remote I2C master at the camera should not attempt to access a remote slave through the BCC that is located at the host controller side of the link. In other words, the control channel should only operate in camera mode for accessing remote slave devices to avoid issues with arbitration across the link. The remote I2C master should also not attempt to access the deserializer registers to avoid a conflict in register access with the Host controller.

If the system does require master-slave operation in both directions across the BCC, some method of communication must be used to ensure only one direction of operation occurs at any time. The communication method could include using available R/W registers in the deserializer to allow masters to communicate with each other to pass control between the two masters. An example would be to use register 0x18 or 0x19 in the deserializer as a mailbox register to pass control of the channel from one master to another.

7.6.3 I2C Restrictions on Multi-Master Operation

The I2C specification does not provide for arbitration between masters under certain conditions. The system should make sure the following conditions cannot occur to prevent undefined conditions on the I2C bus:

- One master generates a repeated start while another master is sending a data bit.
- One master generates a stop while another master is sending a data bit.
- One master generates a repeated start while another master sends a stop.

Note that these restrictions mainly apply to accessing the same register offsets within a specific I2C slave.

7.6.4 Multi-Master Access to Device Registers for Newer FPD-Link III Devices

When using the latest generation of FPD-Link III devices (DS90UB94x-Q1), serializers or deserializer registers may be accessed simultaneously from both local and remote I2C masters. These devices have internal logic to properly arbitrate between sources to allow proper read and write access without risk of corruption.

Access to remote I2C slaves is still be allowed in only one direction at a time (camera or display mode).

7.6.5 Multi-Master Access to Device Registers for Older FPD-Link III Devices

When using older FPD-Link III devices (in backward compatible mode), simultaneous access to serializer or deserializer registers from both local and remote I2C masters may cause incorrect operation. Thus, restrictions must be imposed on accessing of serializer and deserializer registers. The likelihood of an error occurrence is relatively small, but it is possible for collision on reads and writes to occur, resulting in a read or write error.

TI recommends two basic options:

- Allow device register access only from one controller.
In a display mode system, this would allow only the host controller to access the serializer registers (local) and the deserializer registers (remote). A controller at the deserializer (local to the display) would not be allowed to access the deserializer or serializer registers.
- Allow local register access only with no access to remote serializer or deserializer registers.
The host controller would be allowed to access the serializer registers while a controller at the deserializer could access those register only. Access to remote I2C slaves would still be allowed in one direction (camera or display mode).

In a very limited case, remote and local access could be allowed to the deserializer registers at the same time. Register access is ensured to work correctly if both local and remote masters are accessing the same deserializer register. This allows a simple method of passing control of the bidirectional control channel from one master to another.

7.6.6 Restrictions on Control Channel Direction for Multi-Master Operation

Only display or camera mode operation should be active at any time across the bidirectional control channel. If both directions are required, some method of transferring control between I2C masters should be implemented.

7.7 Register Maps

In the register definitions under the *TYPE* and *DEFAULT* heading, the following definitions apply:

- R = Read only access
- R/W = Read / Write access
- R/RC = Read only access, Read to Clear
- (R/W)/SC = Read / Write access, Self-Clearing bit
- (R/W)/S = Read / Write access, Set based on strap pin configuration at start-up
- LL = Latched Low and held until read
- LH = Latched High and held until read
- S = Set based on strap pin configuration at start-up

7.7.1 DS90UB948-Q1 Registers

Table 11 lists the memory-mapped registers for the DS90UB948-Q1 registers. All register offset addresses not listed in Table 11 should be considered as reserved locations and the register contents should not be modified.

7.7.1.1 I2C_DEVICE_ID Register (Address = 0x0) [reset = STRAP]

I2C_DEVICE_ID is shown in and described in [Table 12](#).

Return to [Summary Table](#).

Table 12. I2C_DEVICE_ID Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	DEVICE_ID	R/W	STRAP	7-bit address of Deserializer Defaults to address configured by the IDX strap pin
0	DES_ID	R/W	0x0	0: Device ID is from IDX strap 1: Register I2C Device ID overrides IDX strap

7.7.1.2 RESET Register (Address = 0x1) [reset = 0x0]

RESET is described in [Table 13](#).

Return to [Summary Table](#).

Table 13. RESET Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RESERVED	R	0x0	Reserved
6	RESERVED	R	0x0	Reserved
5	RESERVED	R	0x0	Reserved
4	RESERVED	R	0x0	Reserved
3	RESERVED	R	0x0	Reserved
2	RESERVED	R	0x0	Reserved
1	DIGITAL_RESET0	R/W	0x0	Digital Reset Resets the entire digital block including registers. This bit is self-clearing. 1: Reset 0: Normal operation Registers which are loaded by pin strap will be restored to their original strap value when this bit is set. These registers show 'Strap' as their default value in this table.
0	DIGITAL_RESET1	R/W	0x0	Digital Reset Resets the entire digital block except registers. This bit is self-clearing. 1: Reset 0: Normal operation

7.7.1.3 GENERAL_CONFIGURATION_0 Register (Address = 0x2) [reset = 0x0]

GENERAL_CONFIGURATION_0 is described in [Table 14](#).

Return to [Summary Table](#).

Table 14. GENERAL_CONFIGURATION_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	OUTPUT_ENABLE	R/W	0x0	Output Enable Override Value (in conjunction with Output Sleep State Select) If the Override control is not set, the Output Enable will be set to 1. A Digital reset 0x01[0] should be asserted after toggling Output Enable bit LOW to HIGH
6	OUTPUT_ENABLE_OVERRIDE	R/W	0x0	Overrides Output Enable and Output Sleep State default 0: Disable override 1: Enable override

Table 14. GENERAL_CONFIGURATION_0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	OSC_CLOCK_OUTPUT_ENABLE__AUTO_CLOCK_EN	R/W	0x0	OSC clock output enable If loss of lock OSC clock is output onto PCLK. The frequency is selected in register 0x24. 1: Enable 0: Disable
4	OUTPUT_SLEEP_STATE_SELECT	R/W	0x0	OSS Select Override value to control output state when LOCK is low (used in conjunction with Output Enable) If the Override control is not set, the Output Sleep State Select will be set to 1.
3	RESERVED	R	0x0	Reserved
2	RESERVED	R	0x0	Reserved
1	RESERVED	R	0x0	Reserved
0	RESERVED	R	0x0	Reserved

7.7.1.4 GENERAL_CONFIGURATION_1 Register (Address = 0x3) [reset = 0x70]

GENERAL_CONFIGURATION_1 is described in [Table 15](#).

Return to [Summary Table](#).

Table 15. GENERAL_CONFIGURATION_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RESERVED	R	0x0	Reserved
6	BC_CRC_GENERATOR_ENABLE	R/W	0x1	Back Channel CRC Generator Enable 0: Disable 1: Enable
5	FAILSAFE_LOW	R/W	0x1	Controls the pull direction for undriven LVCMOS inputs 1: Pull down 0: Pull up
4	FILTER_ENABLE	R/W	0x1	HS,VS,DE two clock filter When enabled, pulses less than two full PCLK cycles on the DE, HS, and VS inputs will be rejected. For HS, It is a 2-clock filter for single FPD3 mode and a 4-clock filter for dual FPD3 mode. 1: Filtering enable 0: Filtering disable
3	I2C_PASS_THROUGH	R/W	0x0	I2C Pass-Through to Serializer if decode matches 0: Pass-Through Disabled 1: Pass-Through Enabled
2	AUTO_ACK	R/W	0x0	Automatically Acknowledge I2C writes independent of the forward channel lock state 1: Enable 0: Disable
1	DE_GATE_RGB	R/W	0x0	Gate RGB data with DE signal. RGB data is gated with DE in order to allow packetized audio and block unencrypted data when paired with a serializer that supports HDCP. When paired with a serializer that does not support HDCP, RGB data is not gated with DE by default. However, to enable packetized audio this bit must be set. 1: Gate RGB data with DE (has no effect when paired with a serializer that supports HDCP) 0: Pass RGB data independent of DE (has no effect when paired with a serializer that does not support HDCP)
0	RESERVED	R	0x0	Reserved

7.7.1.5 BCC_WATCHDOG_CONTROL Register (Address = 0x4) [reset = 0xFE]

BCC_WATCHDOG_CONTROL is described in [Table 16](#).

Return to [Summary Table](#).

Table 16. BCC_WATCHDOG_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	BCC_WATCHDOG_TIMER	R/W	0x7F	The watchdog timer allows termination of a control channel transaction if it fails to complete within a programmed amount of time. This field sets the Bidirectional Control Channel Watchdog Timeout value in units of 2 milliseconds. This field should not be set to 0.
0	BCC_WATCHDOG_TIMER_DISABLE	R/W	0x0	Disable Bidirectional Control Channel Watchdog Timer 1: Disables BCC Watchdog Timer operation 0: Enables BCC Watchdog Timer operation

7.7.1.6 I2C_CONTROL_1 Register (Address = 0x5) [reset = 0x1E]

I2C_CONTROL_1 is described in [Table 17](#).

Return to [Summary Table](#).

Table 17. I2C_CONTROL_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	I2C_PASS_THROUGH_ALL	R/W	0x0	I2C Pass-Through All Transactions 0: Disabled 1: Enabled
6-4	I2C_SDA_HOLD	R/W	0x1	Internal SDA Hold Time This field configures the amount of internal hold time provided for the SDA input relative to the SCL input. Units are 50 nanoseconds.
3-0	I2C_FILTER_DEPTH	R/W	0xE	I2C Glitch Filter Depth This field configures the maximum width of glitch pulses on the SCL and SDA inputs that will be rejected. Units are 5 nanoseconds.

7.7.1.7 I2C_CONTROL_2 Register (Address = 0x6) [reset = 0x0]

I2C_CONTROL_2 is described in [Table 18](#).

Return to [Summary Table](#).

Table 18. I2C_CONTROL_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	FORWARD_CHANNEL_SEQUENCE_ERROR	R	0x0	Control Channel Sequence Error Detected This bit indicates a sequence error has been detected in forward control channel. If this bit is set, an error may have occurred in the control channel operation.
6	CLEAR_SEQUENCE_ERROR	R/W	0x0	Clears the Sequence Error Detect bit
5	RESERVED	R	0x0	Reserved
4-3	SDA_Output_Delay	R/W	0x0	SDA Output Delay This field configures output delay on the SDA output. Setting this value will increase output delay in units of 50ns. Nominal output delay values for SCL to SDA are: 00: 250ns 01: 300ns 10: 350ns 11: 400ns

Table 18. I2C_CONTROL_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	LOCAL_WRITE_DISABLE	R/W	0x0	Disable Remote Writes to Local Registers Setting this bit to a 1 will prevent remote writes to local device registers from across the control channel. This prevents writes to the Deserializer registers from an I2C master attached to the Serializer. Setting this bit does not affect remote access to I2C slaves at the Deserializer.
1	I2C_BUS_TIMER_SPEED UP	R/W	0x0	Speed up I2C Bus Watchdog Timer 1: Watchdog Timer expires after approximately 50 microseconds 0: Watchdog Timer expires after approximately 1 second.
0	I2C_BUS_TIMER_DISABLE	R/W	0x0	Disable I2C Bus Watchdog Timer When the I2C Watchdog Timer may be used to detect when the I2C bus is free or hung up following an invalid termination of a transaction. If SDA is high and no signalling occurs for approximately 1 second, the I2C bus will assumed to be free. If SDA is low and no signaling occurs, the device will attempt to clear the bus by driving 9 clocks on SCL.

7.7.1.8 REMOTE_ID Register (Address = 0x7) [reset = 0x0]

REMOTE_ID is described in [Table 19](#).

Return to [Summary Table](#).

Table 19. REMOTE_ID Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	REMOTE_ID	R/W	0x0	7-bit Serializer Device ID Configures the I2C Slave ID of the remote Serializer. A value of 0 in this field disables I2C access to the remote Serializer. This field is automatically loaded from the Serializer once RX Lock has been detected. Software may overwrite this value, but should also assert the FREEZE DEVICE ID bit to prevent loading by the Bidirectional Control Channel.
0	FREEZE_DEVICE_ID	R/W	0x0	Freeze Serializer Device ID Prevent auto-loading of the Serializer Device ID from the Forward Channel. The ID will be frozen at the value written.

7.7.1.9 SLAVEID_0 Register (Address = 0x8) [reset = 0x0]

SLAVEID_0 is described in [Table 20](#).

Return to [Summary Table](#).

Table 20. SLAVEID_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ID0	R/W	0x0	7-bit Remote Slave Device ID 0 Configures the physical I2C address of the remote I2C Slave device attached to the remote Serializer. If an I2C transaction is addressed to the Slave Alias ID0, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved

7.7.1.10 SLAVEID_1 Register (Address = 0x9) [reset = 0x0]

 SLAVEID_1 is described in [Table 21](#).

 Return to [Summary Table](#).

Table 21. SLAVEID_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ID1	R/W	0x0	7-bit Remote Slave Device ID 1 Configures the physical I2C address of the remote I2C Slave device attached to the remote Serializer. If an I2C transaction is addressed to the Slave Alias ID1, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved

7.7.1.11 SLAVEID_2 Register (Address = 0xA) [reset = 0x0]

 SLAVEID_2 is described in [Table 22](#).

 Return to [Summary Table](#).

Table 22. SLAVEID_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ID2	R/W	0x0	7-bit Remote Slave Device ID 2 Configures the physical I2C address of the remote I2C Slave device attached to the remote Serializer. If an I2C transaction is addressed to the Slave Alias ID2, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved

7.7.1.12 SLAVEID_3 Register (Address = 0xB) [reset = 0x0]

 SLAVEID_3 is described in [Table 23](#).

 Return to [Summary Table](#).

Table 23. SLAVEID_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ID3	R/W	0x0	7-bit Remote Slave Device ID 3 Configures the physical I2C address of the remote I2C Slave device attached to the remote Serializer. If an I2C transaction is addressed to the Slave Alias ID3, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved

7.7.1.13 SLAVEID_4 Register (Address = 0xC) [reset = 0x0]

 SLAVEID_4 is described in [Table 24](#).

 Return to [Summary Table](#).

Table 24. SLAVEID_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ID4	R/W	0x0	7-bit Remote Slave Device ID 4v Configures the physical I2C address of the remote I2C Slave device attached to the remote Serializer. If an I2C transaction is addressed to the Slave Alias ID4, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved

7.7.1.14 SLAVEID_5 Register (Address = 0xD) [reset = 0x0]

SLAVEID_5 is described in [Table 25](#).

Return to [Summary Table](#).

Table 25. SLAVEID_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ID5	R/W	0x0	7-bit Remote Slave Device ID 5 Configures the physical I2C address of the remote I2C Slave device attached to the remote Serializer. If an I2C transaction is addressed to the Slave Alias ID5, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved

7.7.1.15 SLAVEID_6 Register (Address = 0xE) [reset = 0x0]

SLAVEID_6 is described in [Table 26](#).

Return to [Summary Table](#).

Table 26. SLAVEID_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ID6	R/W	0x0	7-bit Remote Slave Device ID 6 Configures the physical I2C address of the remote I2C Slave device attached to the remote Serializer. If an I2C transaction is addressed to the Slave Alias ID6, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved

7.7.1.16 SLAVEID_7 Register (Address = 0xF) [reset = 0x0]

SLAVEID_7 is described in [Table 27](#).

Return to [Summary Table](#).

Table 27. SLAVEID_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ID7	R/W	0x0	7-bit Remote Slave Device ID 7 Configures the physical I2C address of the remote I2C Slave device attached to the remote Serializer. If an I2C transaction is addressed to the Slave Alias ID7, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Serializer.
0	RESERVED	R	0x0	Reserved

7.7.1.17 SLAVEALIAS_0 Register (Address = 0x10) [reset = 0x0]

SLAVEALIAS_0 is described in [Table 28](#).

Return to [Summary Table](#).

Table 28. SLAVEALIAS_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ALIAS_ID0	R/W	0x0	7-bit Remote Slave Device Alias ID 0 Configures the decoder for detecting transactions designated for an I2C Slave device attached to the remote Serializer. The transaction will be remapped to the address specified in the Slave ID0 register. A value of 0 in this field disables access to the remote I2C Slave.
0	RESERVED	R	0x0	Reserved

7.7.1.18 SLAVEALIAS_1 Register (Address = 0x11) [reset = 0x0]

 SLAVEALIAS_1 is described in [Table 29](#).

 Return to [Summary Table](#).

Table 29. SLAVEALIAS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ALIAS_ID1	R/W	0x0	7-bit Remote Slave Device Alias ID 1 Configures the decoder for detecting transactions designated for an I2C Slave device attached to the remote Serializer. The transaction will be remapped to the address specified in the Slave ID1 register. A value of 0 in this field disables access to the remote I2C Slave.
0	RESERVED	R	0x0	Reserved

7.7.1.19 SLAVEALIAS_2 Register (Address = 0x12) [reset = 0x0]

 SLAVEALIAS_2 is described in [Table 30](#).

 Return to [Summary Table](#).

Table 30. SLAVEALIAS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ALIAS_ID2	R/W	0x0	7-bit Remote Slave Device Alias ID 2 Configures the decoder for detecting transactions designated for an I2C Slave device attached to the remote Serializer. The transaction will be remapped to the address specified in the Slave ID2 register. A value of 0 in this field disables access to the remote I2C Slave.
0	RESERVED	R	0x0	Reserved

7.7.1.20 SLAVEALIAS_3 Register (Address = 0x13) [reset = 0x0]

 SLAVEALIAS_3 is described in [Table 31](#).

 Return to [Summary Table](#).

Table 31. SLAVEALIAS_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ALIAS_ID3	R/W	0x0	7-bit Remote Slave Device Alias ID 3 Configures the decoder for detecting transactions designated for an I2C Slave device attached to the remote Serializer. The transaction will be remapped to the address specified in the Slave ID3 register. A value of 0 in this field disables access to the remote I2C Slave.
0	RESERVED	R	0x0	Reserved

7.7.1.21 SLAVEALIAS_4 Register (Address = 0x14) [reset = 0x0]

 SLAVEALIAS_4 is described in [Table 32](#).

 Return to [Summary Table](#).

Table 32. SLAVEALIAS_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ALIAS_ID4	R/W	0x0	7-bit Remote Slave Device Alias ID 4 Configures the decoder for detecting transactions designated for an I2C Slave device attached to the remote Serializer. The transaction will be remapped to the address specified in the Slave ID4 register. A value of 0 in this field disables access to the remote I2C Slave.
0	RESERVED	R	0x0	Reserved

7.7.1.22 SLAVEALIAS_5 Register (Address = 0x15) [reset = 0x0]

SLAVEALIAS_5 is described in [Table 33](#).

Return to [Summary Table](#).

Table 33. SLAVEALIAS_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ALIAS_ID5	R/W	0x0	7-bit Remote Slave Device Alias ID 5 Configures the decoder for detecting transactions designated for an I2C Slave device attached to the remote Serializer. The transaction will be remapped to the address specified in the Slave ID5 register. A value of 0 in this field disables access to the remote I2C Slave.
0	RESERVED	R	0x0	Reserved

7.7.1.23 SLAVEALIAS_6 Register (Address = 0x16) [reset = 0x0]

SLAVEALIAS_6 is described in [Table 34](#).

Return to [Summary Table](#).

Table 34. SLAVEALIAS_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ALIAS_ID6	R/W	0x0	7-bit Remote Slave Device Alias ID 6 Configures the decoder for detecting transactions designated for an I2C Slave device attached to the remote Serializer. The transaction will be remapped to the address specified in the Slave ID6 register. A value of 0 in this field disables access to the remote I2C Slave.
0	RESERVED	R	0x0	Reserved

7.7.1.24 SLAVEALIAS_7 Register (Address = 0x17) [reset = 0x0]

SLAVEALIAS_7 is described in [Table 35](#).

Return to [Summary Table](#).

Table 35. SLAVEALIAS_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-1	SLAVE_ALIAS_ID7	R/W	0x0	7-bit Remote Slave Device Alias ID 7 Configures the decoder for detecting transactions designated for an I2C Slave device attached to the remote Serializer. The transaction will be remapped to the address specified in the Slave ID7 register. A value of 0 in this field disables access to the remote I2C Slave.
0	RESERVED	R	0x0	Reserved

7.7.1.25 MAILBOX_18 Register (Address = 0x18) [reset = 0x0]

MAILBOX_18 is described in [Table 36](#).

Return to [Summary Table](#).

Table 36. MAILBOX_18 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	MAILBOX_18	R/W	0x0	Mailbox Register This register is an unused read/write register that can be used for any purpose such as passing messages between I2C masters on opposite ends of the link.

7.7.1.26 MAILBOX_19 Register (Address = 0x19) [reset = 0x1]

 MAILBOX_19 is described in [Table 37](#).

 Return to [Summary Table](#).

Table 37. MAILBOX_19 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	MAILBOX_19	R/W	0x1	Mailbox Register This register is an unused read/write register that can be used for any purpose such as passing messages between I2C masters on opposite ends of the link.

7.7.1.27 GPIO_9_and_GLOBAL_GPIO_CONFIG Register (Address = 0x1A) [reset = 0x0]

 GPIO_9_and_GLOBAL_GPIO_CONFIG is described in [Table 38](#).

 Return to [Summary Table](#).

Table 38. GPIO_9_and_GLOBAL_GPIO_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	GLOBAL_GPIO_OUTPUT_VALUE	R/W	0x0	Global GPIO Output Value This value is output on each GPIO pin when the individual pin is not otherwise enabled as a GPIO and the global GPIO direction is Output
6	RESERVED	R	0x0	Reserved
5	GLOBAL_GPIO_FORCE_DIR	R/W	0x0	The GLOBAL GPIO DIR and GLOBAL GPIO EN bits configure the pad in input direction or output direction for functional mode or GPIO mode. The GLOBAL bits are overridden by the individual GPIO DIR and GPIO EN bits. {GLOBAL GPIO DIR, GLOBAL GPIO EN} 00: Functional mode; output 10: Tri-state 01: Force mode; output 11: Force mode; input
4	GLOBAL_GPIO_FORCE_EN	R/W	0x0	This bit grouped together with bit 5 to form the configuration of GPIO DIR and GPIO EN.
3	GPIO9_OUTPUT_VALUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
2	RESERVED	R	0x0	Reserved
1	GPIO9_DIR	R/W	0x0	The GPIO DIR and GPIO EN bits configure the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
0	GPIO9_EN	R/W	0x0	This bit grouped together with bit 1 to form the configuration of GPIO DIR and GPIO EN.

7.7.1.28 FREQUENCY_COUNTER Register (Address = 0x1B) [reset = 0x0]

FREQUENCY_COUNTER is shown in and described in [Table 39](#).

Return to [Summary Table](#).

Table 39. FREQUENCY_COUNTER Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	Frequency_Count	R/W	0x0	Frequency Counter control A write to this register will enable a frequency counter to count the number of pixel clock during a specified time interval. The time interval is equal to the value written multiplied by the oscillator clock period (nominally 50ns). A read of the register returns the number of pixel clock edges seen during the enabled interval. The frequency counter will freeze at 0xff if it reaches the maximum value. The frequency counter will provide a rough estimate of the pixel clock period. If the pixel clock frequency is known, the frequency counter may be used to determine the actual oscillator clock frequency.

7.7.1.29 GENERAL_STATUS Register (Address = 0x1C) [reset = 0x0]

GENERAL_STATUS is described in [Table 40](#).

Return to [Summary Table](#).

Table 40. GENERAL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
7-6	RESERVED	R	0x0	Reserved
5	DUAL_TX_STS	R	0x0	Transmitter Dual Link Status: This bit indicates the current operating mode of the FPD-Link Transmit port 1: Dual-link mode active 0: Single-link mode active
4	DUAL_RX_STS	R	0x0	Receiver Dual Link Status: This bit indicates the current operating mode of the FPD-Link III Receive port 1: Dual-link mode active 0: Single-link mode active
3	I2S_LOCKED	R	0x0	I2S LOCK STATUS 0: I2S PLL controller not locked 1: I2S PLL controller locked to input i2s clock
2	RESERVED	R	0x0	Reserved
1	SIGNAL_DETECT	R	0x0	1: Serial input detected 0: Serial input not detected
0	LOCK	R	0x0	De-Serializer CDR, PLL's clock to recovered clock frequency 1: De-Serializer locked to recovered clock 0: De-Serializer not locked In Dual-link mode, this indicates both channels are locked.

7.7.1.30 GPIO0_CONFIG Register (Address = 0x1D) [reset = 0x3]

GPIO0_CONFIG is described in [Table 41](#).

Return to [Summary Table](#).

GPIO0 and D_GPIO0 Configuration: If PORT1_SEL is set, this register controls the D_GPIO0 pin

Table 41. GPIO0_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	Rev_ID	R	0x0	Revision ID 0001: B1

Table 41. GPIO0_CONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	GPIO0_OUTPUT_VALUE _D_GPIO0_OUTPUT_VA LUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
2	GPIO0_REMOTE_ENABL E _D_GPIO0_REMOTE_EN ABLE	R/W	0x0	Remote GPIO Control 1: Enable GPIO control from remote Serializer. The GPIO pin will be an output, and the value is received from the remote Serializer. 0: Disable GPIO control from remote Serializer.
1	GPIO0_DIR _D_GPIO0_DIR	R/W	0x1	The GPIO DIR and GPIO EN configures the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
0	GPIO0_EN _D_GPIO0_EN	R/W	0x1	This bit grouped together with bit 1 to form the configuration of GPIO DIR and GPIO EN.

7.7.1.31 GPIO1_2_CONFIG Register (Address = 0x1E) [reset = 0x3]

 GPIO1_2_CONFIG is described in [Table 42](#).

 Return to [Summary Table](#).

GPIO1/GPIO2 and D_GPIO1/D_GPIO2 Configuration: If PORT1_SEL is set, this register controls the D_GPIO1 and D_GPIO2 pins

Table 42. GPIO1_2_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	GPIO2_OUTPUT_VALUE _D_GPIO2_OUTPUT_VA LUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
6	GPIO2_REMOTE_ENABL E _D_GPIO2_REMOTE_EN ABLE	R/W	0x0	Remote GPIO Control 1: Enable GPIO control from remote Serializer. The GPIO pin will be an output, and the value is received from the remote Serializer. 0: Disable GPIO control from remote Serializer.
5	GPIO2_DIR _D_GPIO2_DIR	R/W	0x0	The GPIO DIR and GPIO EN configures the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
4	GPIO2_EN _D_GPIO2_EN	R/W	0x0	This bit grouped together with bit 5 to form the configuration of GPIO DIR and GPIO EN.
3	GPIO1_OUTPUT_VALUE _D_GPIO1_OUTPUT_VA LUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
2	GPIO1_REMOTE_ENABL E _D_GPIO1_REMOTE_EN ABLE	R/W	0x0	Remote GPIO Control 1: Enable GPIO control from remote Serializer. The GPIO pin will be an output, and the value is received from the remote Serializer. 0: Disable GPIO control from remote Serializer.

Table 42. GPIO1_2_CONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	GPIO1_DIR _D_GPIO1_DIR	R/W	0x1	The GPIO DIR and GPIO EN configures the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
0	GPIO1_EN _D_GPIO1_EN	R/W	0x1	This bit grouped together with bit 1 to form the configuration of GPIO DIR and GPIO EN.

7.7.1.32 GPIO3_CONFIG Register (Address = 0x1F) [reset = 0x2]

GPIO3_CONFIG is described in [Table 43](#).

Return to [Summary Table](#).

GPIO3 and D_GPIO3 Configuration: If PORT1_SEL is set, this register controls the D_GPIO3 pin

Table 43. GPIO3_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	RESERVED	R	0x0	Reserved
3	GPIO3_OUTPUT_VALUE _D_GPIO3_OUTPUT_VALUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
2	GPIO3_REMOTE_ENABLE _D_GPIO3_REMOTE_ENABLE	R/W	0x0	Remote GPIO Control 1: Enable GPIO control from remote Serializer. The GPIO pin will be an output, and the value is received from the remote Serializer. 0: Disable GPIO control from remote Serializer.
1	GPIO3_DIR _D_GPIO3_DIR	R/W	0x1	The GPIO DIR and GPIO EN configures the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
0	GPIO3_EN _D_GPIO3_EN	R/W	0x0	This bit grouped together with bit 1 to form the configuration of GPIO DIR and GPIO EN.

7.7.1.33 GPIO5_6_CONFIG Register (Address = 0x20) [reset = 0x0]

GPIO5_6_CONFIG is described in [Table 44](#).

Return to [Summary Table](#).

Table 44. GPIO5_6_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	GPIO6_OUTPUT_VALUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
6	GPIO6_REMOTE_ENABLE	R/W	0x0	Remote GPIO Control 1: Enable GPIO control from remote Serializer. The GPIO pin will be an output, and the value is received from the remote Serializer. 0: Disable GPIO control from remote Serializer.

Table 44. GPIO5_6_CONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	GPIO6_DIR	R/W	0x0	The GPIO DIR and GPIO EN configures the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
4	GPIO6_EN	R/W	0x0	This bit grouped together with bit 5 to form the configuration of GPIO DIR and GPIO EN.
3	GPIO5_OUTPUT_VALUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
2	GPIO5_REMOTE_ENAB LE	R/W	0x0	Remote GPIO Control 1: Enable GPIO control from remote Serializer. The GPIO pin will be an output, and the value is received from the remote Serializer. 0: Disable GPIO control from remote Serializer.
1	GPIO5_DIR	R/W	0x0	The GPIO DIR and GPIO EN configures the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
0	GPIO5_EN	R/W	0x0	This bit grouped together with bit 1 to form the configuration of GPIO DIR and GPIO EN.

7.7.1.34 GPIO7_8_CONFIG Register (Address = 0x21) [reset = 0x0]

GPIO7_8_CONFIG is described in [Table 45](#).

Return to [Summary Table](#).

Table 45. GPIO7_8_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	GPIO8_OUTPUT_VALUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.
6	GPIO8_REMOTE_ENAB LE	R/W	0x0	Remote GPIO Control 1: Enable GPIO control from remote Serializer. The GPIO pin will be an output, and the value is received from the remote Serializer. 0: Disable GPIO control from remote Serializer.
5	GPIO8_DIR	R/W	0x0	The GPIO DIR and GPIO EN configures the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
4	GPIO8_EN	R/W	0x0	This bit grouped together with bit 5 to form the configuration of GPIO DIR and GPIO EN.
3	GPIO7_OUTPUT_VALUE	R/W	0x0	Local GPIO Output Value This value is output on the GPIO pin when the GPIO function is enabled, the local GPIO direction is Output, and remote GPIO control is disabled.

Table 45. GPIO7_8_CONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	GPIO7_REMOTE_ENAB LE	R/W	0x0	Remote GPIO Control 1: Enable GPIO control from remote Serializer. The GPIO pin will be an output, and the value is received from the remote Serializer. 0: Disable GPIO control from remote Serializer.
1	GPIO7_DIR	R/W	0x0	The GPIO DIR and GPIO EN configures the pad in input direction or output direction for functional mode or GPIO mode. {GPIO DIR, GPIO EN} 00: Functional mode; output 10: Tri-state 01: GPIO mode; output 11: GPIO mode; input
0	GPIO7_EN	R/W	0x0	This bit grouped together with bit 1 to form the configuration of GPIO DIR and GPIO EN.

7.7.1.35 DATAPATH_CONTROL Register (Address = 0x22) [reset = 0x0]

DATAPATH_CONTROL is described in [Table 46](#).

Return to [Summary Table](#).

Table 46. DATAPATH_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7	OVERRIDE_FC_CONFIG	R/W	0x0	1: Disable loading of this register from the forward channel, keeping locally written values intact 0: Allow forward channel loading of this register
6	PASS_RGB	R/W	0x0	Setting this bit causes RGB data to be sent independent of DE. This allows operation in systems which may not use DE to frame video data or send other data when DE is deasserted. Note that setting this bit prevents HDCP operation and blocks packetized audio. This bit does not need to be set in DS90UB928 or in Backward Compatibility mode. 1: Pass RGB independent of DE 0: Normal operation Note: this bit is automatically loaded from the remote serializer unless bit 7 of this register is set.
5	DE_POLARITY	R/W	0x0	This bit indicates the polarity of the DE (Data Enable) signal. 1: DE is inverted (active low, idle high) 0: DE is positive (active high, idle low) Note: this bit is automatically loaded from the remote serializer unless bit 7 of this register is set.
4	I2S_RPTR_REGEN	R/W	0x0	This bit controls whether the HDCP Receiver outputs packetized Auxiliary/Audio data on the RGB video output pins. 1: Don't output packetized audio data on RGB video output pins 0: Output packetized audio on RGB video output pins. Note: this bit is automatically loaded from the remote serializer unless bit 7 of this register is set.
3	I2S_4_CHANNEL_ENABL E_OVERRIDE	R/W	0x0	1: Set I2S 4-Channel Enable from bit of of this register 0: Set I2S 4-Channel disabled Note: this bit is automatically loaded from the remote serializer unless bit 7 of this register is set.
2	18_BIT_VIDEO_SELECT	R/W	0x0	1: Select 18-bit video mode 0: Select 24-bit video mode Note: this bit is automatically loaded from the remote serializer unless bit 7 of this register is set.
1	I2S_TRANSPORT_SELE CT	R/W	0x0	1: Enable I2S In-Band Transport 0: Enable I2S Data Island Transport Note: this bit is automatically loaded from the remote serializer unless bit 7 of this register is set.

Table 46. DATAPATH_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	I2S_4_CHANNEL_ENABLE	R/W	0x0	I2S 4-Channel Enable 1: Enable I2S 4-Channel 0: Disable I2S 4-Channel Note: this bit is automatically loaded from the remote serializer unless bit 7 of this register is set.

7.7.1.36 RX_MODE_STATUS Register (Address = 0x23) [reset = X]

 RX_MODE_STATUS is described in [Table 47](#).

 Return to [Summary Table](#).

Table 47. RX_MODE_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RESERVED	R	0x0	Reserved
6	BC_FREQ_SELECT	R/W	0x0	Back Channel Frequency Select 0: Divide-by-4 frequency based on the OSC CLOCK DIVIDER in Register 0x32 1: Divide-by-2 frequency based on the OSC CLOCK DIVIDER in Register 0x32 This bit will be ignored if BC_HIGH_SPEED is set to a 1. Note that changing this setting will result in some errors on the back channel for a short period of time. If set over the control channel, the Serializer should first be programmed to Auto-Ack operation (Serializer register 0x03, bit 5) to avoid a control channel timeout due to lack of response from the Deserializer.
5	AUTO_I2S	R/W	0x1	Auto I2S Determine I2S mode from the AUX data codes.
4	BC_HIGH_SPEED	R/W	X	Back-Channel High-Speed control Enables high-speed back-channel at 20Mbps This bit will override the BC_FREQ_SELECT setting Note that changing this setting will result in some errors on the back channel for a short period of time. If set over the control channel, the Serializer should first be programmed to Auto-Ack operation (Serializer register 0x03, bit 5) to avoid a control channel timeout due to lack of response from the Deserializer. BC_HIGH_SPEED is loaded from the MODE_SEL1 pin strap options.
3	COAX_MODE	R/W	X	Coax Mode Configures the FPD3 Receiver for operation over Coax or STP cabling: 0 : Shielded Twisted pair (STP) 1 : Coax Coax Mode is loaded from the MODE_SEL1 pin strap options.
2	REPEATER_MODE	R	X	Repeater Mode Indicates device is strapped to repeater mode. Repeater Mode is loaded from the MODE_SEL1 pin strap options.
1	RESERVED	R	0x0	Reserved
0	RESERVED	R	0x0	Reserved

7.7.1.37 BIST_CONTROL Register (Address = 0x24) [reset = 0x8]

BIST_CONTROL is described in [Table 48](#).

Return to [Summary Table](#).

Table 48. BIST_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7-6	BIST_OUT_MODE	R/W	0x0	BIST Output Mode 00 : No toggling 01 : Alternating 1/0 toggling 1x : Toggle based on BIST data
5-4	AUTO_OSC_FREQ	R/W	0x0	When register 0x02 bit 5 (AUTO)CLOCK_EN) is set, this field controls the nominal frequency of the oscillator-based receive clock. 00: 50 MHz 01: 25 MHz 10: 10 MHz 11: Reserved (selects analog 25 MHz, but not for customer use)
3	BIST_PIN_CONFIG	R/W	0x1	Bist Configured through Pin. 1: Bist configured through pin. 0: Bist configured through bits 2:0 in this register
2-1	BIST_CLOCK_SOURCE	R/W	0x0	BIST Clock Source This register field selects the BIST Clock Source at the Serializer. These register bits are automatically written to the CLOCK_SOURCE bits (register offset 0x14) in the Serializer after BIST is enabled. See the appropriate Serializer register descriptions for details.
0	BIST_EN	R/W	0x0	BIST Control 1: Enabled 0: Disabled

7.7.1.38 BIST_ERROR_COUNT Register (Address = 0x25) [reset = 0x0]

BIST_ERROR_COUNT is described in [Table 49](#).

Return to [Summary Table](#).

Table 49. BIST_ERROR_COUNT Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	BIST_ERROR_COUNT	R	0x0	Bist Error Count Returns BIST error count for selected port. Port selected is based on the PORT1_SEL control in the DUAL_RX_CTL register.

7.7.1.39 SCL_HIGH_TIME Register (Address = 0x26) [reset = 0x83]

SCL_HIGH_TIME is described in [Table 50](#).

Return to [Summary Table](#).

Table 50. SCL_HIGH_TIME Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	SCL_HIGH_TIME	R/W	0x83	I2C Master SCL High Time This field configures the high pulse width of the SCL output when the De-Serializer is the Master on the local I2C bus. Units are 50 ns for the nominal oscillator clock frequency. The default value is set to provide a minimum 5us SCL high time with the internal oscillator clock running at 26MHz rather than the nominal 20MHz.

7.7.1.40 SCL_LOW_TIME Register (Address = 0x27) [reset = 0x84]

SCL_LOW_TIME is described in [Table 51](#).

Return to [Summary Table](#).

Table 51. SCL_LOW_TIME Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	SCL_LOW_TIME	R/W	0x84	I2C SCL Low Time This field configures the low pulse width of the SCL output when the De-Serializer is the Master on the local I2C bus. This value is also used as the SDA setup time by the I2C Slave for providing data prior to releasing SCL during accesses over the Bidirectional Control Channel. Units are 50 ns for the nominal oscillator clock frequency. The default value is set to provide a minimum 5us SCL low time with the internal oscillator clock running at 26MHz rather than the nominal 20MHz.

7.7.1.41 DATAPATH_CONTROL_2 Register (Address = 0x28) [reset = 0x20]

DATAPATH_CONTROL_2 is described in [Table 52](#).

Return to [Summary Table](#).

Table 52. DATAPATH_CONTROL_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	OVERRIDE_FC_CONFIG	R/W	0x0	1: Disable loading of this register from the forward channel, keeping locally written values intact 0: Allow forward channel loading of this register
6	RESERVED	R	0x0	Reserved
5	VIDEO_DISABLED	R/W	0x1	Forward channel video disabled 0 : Normal operation 1 : Video is disabled, control channel is enabled This is a status bit indicating the forward channel is not sending active video. In this mode, the control channel and GPIO functions are enabled.
4	DUAL_LINK	R/W	0x0	1: Dual-Link mode enabled 0: Single-Link mode enabled This bit indicates whether the FPD3 serializer is in single link or dual link mode. This control is used for recovering forward channel data when the FPD3 Reciever is in auto-detect mode. To force DUAL_LINK receive mode, use the RX_PORT_SEL register (address 0x34).
3	ALTERNATE_I2S_ENABLE	R/W	0x0	1: Enable alternate I2S output on GPIO1 (word clock) and GPIO0 (data) 0: Normal Operation
2	I2S_DISABLED	R/W	0x0	1: I2S DISABLED 0: Normal Operation
1	28_BIT_VIDEO	R/W	0x0	1: 28 bit Video enable. i.e. HS, VS, DE are present in forward channel. 0: Normal Operation
0	I2S_SURROUND	R/W	0x0	1: I2S Surround enabled 0: I2S Surround disabled

7.7.1.42 FRC_CONTROL Register (Address = 0x29) [reset = 0x0]

FRC_CONTROL is described in [Table 53](#).

Return to [Summary Table](#).

Table 53. FRC_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7	Timing_Mode_Select	R/W	0x0	Select display timing mode 0: DE only Mode 1: Sync Mode (VS,HS)
6	HS_Polarity	R/W	0x0	0: Active High 1: Active Low
5	VS_Polarity	R/W	0x0	0: Active High 1: Active Low
4	DE_Polarity	R/W	0x0	0: Active High 1: Active Low
3	FRC2_Enable	R/W	0x0	0: FRC2 disable 1: FRC2 enable
2	FRC1_Enable	R/W	0x0	0: FRC1 disable 1: FRC1 enable
1	Hi-FRC2_Disable	R/W	0x0	0: Hi-FRC2 enable 1: Hi-FRC2 disable
0	Hi-FRC1_Disable	R/W	0x0	0: Hi-FRC1 enable 1: Hi-FRC1 disable

7.7.1.43 WHITE_BALANCE_CONTROL Register (Address = 0x2A) [reset = 0x0]

WHITE_BALANCE_CONTROL is described in [Table 54](#).

Return to [Summary Table](#).

Table 54. WHITE_BALANCE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7-6	Page_Setting	R/W	0x0	Page setting 00: Configuration Registers 01: Red LUT 10: Green LUT 11: Blue LUT
5	White_Balance_Enable	R/W	0x0	0: White Balance Disable 1: White Balance Enable
4	LUT_Reload_Enable	R/W	0x0	0: Reload Disable 1: Reload Enable
3	RESERVED	R	0x0	Reserved
2	RESERVED	R	0x0	Reserved
1-0	RESERVED	R	0x0	Reserved

7.7.1.44 I2S_CONTROL Register (Address = 0x2B) [reset = 0x0]

I2S_CONTROL is described in [Table 55](#).

Return to [Summary Table](#).

Table 55. I2S_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RESERVED	R	0x0	Reserved
6	RESERVED	R	0x0	Reserved
5-4	RESERVED	R	0x0	Reserved

Table 55. I2S_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	I2S_FIFO_OVERRUN_STATUS	R	0x0	I2S FIFO Overrun Status
2	I2S_FIFO_UNDERRUN_STATUS	R	0x0	I2S FIFO Underrun Status
1	I2S_FIFO_ERROR_RESET	R/W	0x0	I2S Fifo Error Reset 1: Clears FIFO Error
0	I2S_DATA_FALLING_EDGE	R/W	0x0	I2S Clock Edge Select 1: I2S Data is strobed on the Rising Clock Edge. 0: I2S Data is strobed on the Falling Clock Edge.

7.7.1.45 PCLK_TEST_MODE Register (Address = 0x2E) [reset = 0x0]

 PCLK_TEST_MODE is described in [Table 56](#).

 Return to [Summary Table](#).

Table 56. PCLK_TEST_MODE Register Field Descriptions

Bit	Field	Type	Reset	Description
7	EXTERNAL_PCLK	R/W	0x0	Select pixel clock from BISTC input
6-0	RESERVED	R	0x0	Reserved

7.7.1.46 DUAL_RX_CTL Register (Address = 0x34) [reset = 0x1]

 DUAL_RX_CTL is described in [Table 57](#).

 Return to [Summary Table](#).

Table 57. DUAL_RX_CTL Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RESERVED	R	0x0	Reserved
6	RX_LOCK_MODE	R/W	0x0	RX Lock Mode: Determines operating conditions for indication of RX_LOCK and generation of video data. 0 : RX_LOCK asserted only when receiving active video (Forward channel VIDEO_DISABLED bit is 0) 1 : RX_LOCK asserted when device is linked to a Serializer even if active video is not being sent. This allows indication of valid link where Bidirectional Control Channel is enabled, but Deserializer is not receiving Audio/Video data.
5	RAW_2ND_BC	R/W	0x0	Enable Raw Secondary Back channel if this bit is set to a 1, the secondary back channel will operate in a raw mode, passing D_GPIO0 from the Deserializer to the Serializer, without any oversampling or filtering.
4-3	FPD3_INPUT_MODE	R/W	0x0	FPD-Link III Input Mode Determines operating mode of dual FPD-Link III Receive interface 00: Auto-detect based on received data 01: Forced Mode: Dual link 10: Forced Mode: Single link, primary input 11: Forced Mode: Single link, secondary input
2	RESERVED	R	0x0	Reserved
1	PORT1_SEL	R/W	0x0	Selects Port 1 for Register Access from primary I2C Address For writes, port1 registers and shared registers will both be written. For reads, port1 registers and shared registers will be read. This bit must be cleared to read port0 registers.

Table 57. DUAL_RX_CTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	PORT0_SEL	R/W	0x1	Selects Port 0 for Register Access from primary I2C Address For writes, port0 registers and shared registers will both be written. For reads, port0 registers and shared registers will be read. Note that if PORT1_SEL is also set, then port1 registers will be read.

7.7.1.47 AEQ_TEST Register (Address = 0x35) [reset = 0x0]

AEQ_TEST is described in [Table 58](#).

Return to [Summary Table](#).

AEQ Test register: If PORT1_SEL is set, this register sets port1 AEQ controls.

Table 58. AEQ_TEST Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RESERVED	R	0x0	Reserved
6	AEQ_RESTART	R/W	0x0	Set high to restart AEQ adaptation from initial value. Method is write HIGH then write LOW - not self clearing. Adaption will be restarted on both ports.
5	OVERRIDE_AEQ_FLOOR	R/W	0x0	Enable operation of SET_AEQ_FLOOR
4	SET_AEQ_FLOOR	R/W	0x0	AEQ adaptation starts from a pre-set floor value rather than from zero - good in long cable situations
3-1	RESERVED	R	0x0	Reserved
0	RESERVED	R	0x0	Reserved

7.7.1.48 MODE_SEL Register (Address = 0x37) [reset = 0x0]

MODE_SEL is described in [Table 59](#).

Return to [Summary Table](#).

Table 59. MODE_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
7	MODE_SEL1_DONE	R	0x0	MODE_SEL1 Done: 0: indicates the MODE_SEL1 decode has not been latched into the MODE_SEL1 status bits. 1: indicates the MODE_SEL1 decode has completed and latched into the MODE_SEL1 status bits. If set, indicates the MODE_SEL1 decode has completed and latched into the MODE_SEL1 status bits.
6-4	MODE_SEL1	R	0x0	MODE_SEL1 Decode 3-bit decode from MODE_SEL1 pin, see MODE_SEL1 Table 9 first column "#" for mode selection: 000: 5 Mbps/STP (#1 on MODE_SEL1) 001: 5 Mbps/Coax (#2 on MODE_SEL1) 010: 20 Mbps/STP (#3 on MODE_SEL1) 011: 20 Mbps/Coax (#4 on MODE_SEL1) 100: 5 Mbps/STP (#5 on MODE_SEL1) 101: 5 Mbps/Coax (#6 on MODE_SEL1) 110: 20 Mbps/STP (#7 on MODE_SEL1) 111: 20 Mbps/Coax (#8 on MODE_SEL1) Note: 0x37[6] is the MSB; 0x37[4] is the LSB

Table 59. MODE_SEL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MODE_SEL0_DONE	R	0x0	MODE_SEL0 Done: 0: indicates the MODE_SEL0 decode has not been latched into the MODE_SEL0 status bits. 1: indicates the MODE_SEL0 decode has completed and latched into the MODE_SEL0 status bits. If set, indicates the MODE_SEL0 decode has completed and latched into the MODE_SEL0 status bits.
2-0	MODE_SEL0	R	0x0	MODE_SEL0 Decode 3-bit decode from MODE_SEL0 pin, see MODE_SEL0 in Table 8 first column "#" for mode selection: 000: Dual OLDI output (#1 on MODE_SEL0) 001: Dual SWAP output (#2 on MODE_SEL0) 010: Single OLDI output (#3 on MODE_SEL0) 011: Replicate (#4 on MODE_SEL0) 100: Dual OLDI output (#5 on MODE_SEL0) 101: Dual SWAP output (#6 on MODE_SEL0) 110: Single OLDI output (#7 on MODE_SEL0) 111: Replicate (#8 on MODE_SEL0) Note: 0x37[2] is the MSB; 0x37[0] is the LSB

7.7.1.49 I2S_DIVSEL Register (Address = 0x3A) [reset = 0x0]

 I2S_DIVSEL is described in [Table 60](#).

 Return to [Summary Table](#).

Table 60. I2S_DIVSEL Register Field Descriptions

Bit	Field	Type	Reset	Description
7	reg_ov_mdiv	R/W	0x0	0: No override for MCLK divider 1: Override divider select for MCLK
6-4	reg_mdiv	R/W	0x0	Divide ratio select for VCO output (32*REF/M) 000: Divide by 32 (=REF/M) 001: Divide by 16 (=2*REF/M) 010: Divide by 8 (=4*REF/M) 011: Divide by 4 (=8*REF/M) 100, 101: Divide by 2 (=16*REF/M) 110, 111: Divide by 1 (32*REF/M)
3	RESERVED	R	0x0	Reserved
2	reg_ov_mselect	R/W	0x0	0: Divide ratio of reference clock VCO selected by PLL-SM 1: Override divide ratio of clock to VCO
1-0	reg_mselect	R/W	0x0	Divide ratio select for VCO input (M) 00: Divide by 1 01: Divide by 2 10: Divide by 4 11: Divide by 8

7.7.1.50 EQ_STATUS Register (Address = 0x3B) [reset = 0x0]

 EQ_STATUS is described in [Table 61](#).

 Return to [Summary Table](#).

Equalizer Status register: If PORT1_SEL is set, this register returns port1 status.

Table 61. EQ_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
7-6	RESERVED	R	0x0	Reserved

Table 61. EQ_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5-0	EQ_status	R	0x0	EQ Status - setting direct to analog If Adaptive EQ is bypassed, these values are the {EQ2, EQ1} settings from the ADAPTIVE EQ BYPASS register (0x44). If Adaptive EQ is enabled, the EQ status is determined by the adaptive Equalizer.

7.7.1.51 LINK_ERROR_COUNT Register (Address = 0x41) [reset = 0x3]

LINK_ERROR_COUNT is described in [Table 62](#).

Return to [Summary Table](#).

Table 62. LINK_ERROR_COUNT Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RESERVED	R	0x0	Reserved
6-5	RESERVED	R	0x0	Reserved
4	LINK_ERROR_COUNT_ENABLE	R/W	0x0	Enable serial link data integrity error count 1: Enable error count 0: DISABLE
3-0	LINK_ERROR_COUNT	R/W	0x3	Link error count threshold. Counter is pixel clock based. clk0, clk1 and DCA are monitored for link errors, if error count is enabled, deserializer loose lock once error count reaches threshold. If disabled deserializer loose lock with one error.

7.7.1.52 HSCC_CONTROL Register (Address = 0x43) [reset = 0x0]

HSCC_CONTROL is described in [Table 63](#).

Return to [Summary Table](#).

Table 63. HSCC_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	RESERVED	R	0x0	Reserved
4	SPI_MISO_MODE	R/W	0x0	SPI MISO pin mode during Reverse SPI mode During Reverse SPI mode, SPI_MISO is typically an output signal. For bused SPI applications, it may be necessary to tri-state the SPI_MISO output if the device is not selected (SPI_SS = 0). 0 : Always enable SPI_MISO output driver 1 : Tri-state SPI_MISO output if SPI_SS is not asserted (low)
3	SPI_CPOL	R/W	0x0	SPI Clock Polarity Control 0 : SPI Data driven on Falling clock edge, sampled on Rising clock edge 1 : SPI Data driven on Rising clock edge, sampled on Falling clock edge
2-0	HSCC_MODE	R/W	0x0	High-Speed Control Channel Mode Enables high-speed modes for the secondary link back-channel, allowing higher speed signaling of GPIOs or SPI interface: These bits indicates the High Speed Control Channel mode of operation: 000: Normal frame, GPIO mode 001: High Speed GPIO mode, 1 GPIO 010: High Speed GPIO mode, 2 GPIOs 011: High Speed GPIO mode: 4 GPIOs 100: Reserved 101: Reserved 110: High Speed, Forward Channel SPI mode 111: High Speed, Reverse Channel SPI mode

7.7.1.53 ADAPTIVE_EQ_BYPASS Register (Address = 0x44) [reset = 0x60]

ADAPTIVE_EQ_BYPASS is described in [Table 64](#).

Return to [Summary Table](#).

Adaptive Equalizer Bypass register: If PORT1_SEL is set, this register sets port1 AEQ controls.

Table 64. ADAPTIVE_EQ_BYPASS Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	EQ_STAGE_1_SELECT_VALUE	R/W	0x3	EQ select value[2:0] - Used if adaptive EQ is bypassed. When ADAPTIVE_EQ_BYPASS is set to 1, these bits will be reflected in EQ Status[2:0] (register 0x3B)
4	RESERVED	R	0x0	Reserved
3-1	EQ_STAGE_2_SELECT_VALUE	R/W	0x0	EQ select value[5:3] - Used if adaptive EQ is bypassed. When ADAPTIVE_EQ_BYPASS is set to 1, these bits will be reflected in EQ Status[5:3] (register 0x3B)
0	ADAPTIVE_EQ_BYPASS	R/W	0x0	1: Disable adaptive EQ 0: Enable adaptive EQ

7.7.1.54 ADAPTIVE_EQ_MIN_MAX Register (Address = 0x45) [reset = 0x8]

ADAPTIVE_EQ_MIN_MAX is described in [Table 65](#).

Return to [Summary Table](#).

Adaptive Equalizer Configuration: If PORT1_SEL is set, this register sets port1 AEQ configuration.

Table 65. ADAPTIVE_EQ_MIN_MAX Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	RESERVED	R	0x0	Reserved
4	RESERVED	R	0x0	Reserved
3-0	ADAPTIVE_EQ_FLOOR_VALUE	R/W	0x8	When AEQ floor is enabled by register {reg_35[5:4]} the starting setting is given by this register.

7.7.1.55 FPD_TX_MODE Register (Address = 0x49) [reset = X]

FPD_TX_MODE is described in [Table 66](#).

Return to [Summary Table](#).

Table 66. FPD_TX_MODE Register Field Descriptions

Bit	Field	Type	Reset	Description
7	MAPSEL_MODE	R	X	Mapsel Pin Status Strap option on the MODE_SEL0 pin
6	MAPSEL_OVER_WRITE	R/W	0x0	Mapsel Over Write enable from register configuration
5	MAPSEL_REG_BIT	R/W	0x0	Register setting of MAPSEL mode if MAPSEL OVER WRITE is set
4-2	RESERVED	R	0x0	Reserved
1-0	FPD_OUT_MODE	R/W	X	FPD/OLDI output mode Controls single/dual operation of the FPD Transmit ports 00 : Dual FPD/OLDI output 01 : Dual SWAP FPD/OLDI output 10 : Single FPD/OLDI output 11 : Replicate FPD/OLDI output The FPD_OUT_MODE register bits are loaded at reset from the MODE_SEL0 pin strap options.

7.7.1.56 LVDS_CONTROL Register (Address = 0x4B) [reset = 0x0]

LVDS_CONTROL is described in [Table 67](#).

Return to [Summary Table](#).

Table 67. LVDS_CONTROL Register Field Descriptions

7.7.1.61 PGCTL Register (Address = 0x64) [reset = 0x10]

PGCTL is described in [Table 72](#).

Return to [Summary Table](#).

Table 72. PGCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	PATGEN_SEL	R/W	0x1	Fixed Pattern Select: This field selects the pattern to output when in Fixed Pattern Mode. Scaled patterns are evenly distributed across the horizontal or vertical active regions. This field is ignored when Auto-Scrolling Mode is enabled. The following table shows the color selections in non-inverted followed by inverted color mode: 0000: Reserved 0001: White/Black 0010: Black/White 0011: Red/Cyan 0100: Green/Magenta 0101: Blue/Yellow 0110: Horizontally Scaled Black to White/White to Black 0111: Horizontally Scaled Black to Red/White to Cyan 1000: Horizontally Scaled Black to Green/White to Magenta 1001: Horizontally Scaled Black to Blue/White to Yellow 1010: Vertically Scaled Black to White/White to Black 1011: Vertically Scaled Black to Red/White to Cyan 1100: Vertically Scaled Black to Green/White to Magenta 1101: Vertically Scaled Black to Blue/White to Yellow 1110: Custom color (or its inversion) configured in PGRS, PGGS, PGBS registers 1111: Reserved
3	PATGEN_UNH	R/W	0x0	Enables the UNH-IOL compliance test pattern: 0: Pattern type selected by PATGEN_SEL 1: Compliance test pattern is selected. Value of PATGEN_SEL is ignored.
2	PATGEN_COLOR_BARS	R/W	0x0	Enable Color Bars: 0: Color Bars disabled 1: Color Bars enabled (White, Yellow, Cyan, Green, Magenta, Red, Blue, Black)
1	PATGEN_VCOM_REV	R/W	0x0	Reverse order of color bands in VCOM pattern: 0: Color sequence from top left is (Yellow, Cyan, Blue, Red) 1: Color sequence from top left is (Blue, Cyan, Yellow, Red)
0	PATGEN_EN	R/W	0x0	Pattern Generator Enable: 1: Enable Pattern Generator 0: Disable Pattern Generator NOTE: CML TX must be powered down prior to enabling Pattern Generator by setting register bit 0x63[0]=1.

7.7.1.62 PGCFG Register (Address = 0x65) [reset = 0x0]

PGCFG is described in [Table 73](#).

Return to [Summary Table](#).

Table 73. PGCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	RESERVED	R	0x0	Reserved
4	PATGEN_18B	R/W	0x0	18-bit Mode Select: 1: Enable 18-bit color pattern generation. Scaled patterns will have 64 levels of brightness and the R, G, and B outputs use the six most significant color bits. 0: Enable 24-bit pattern generation. Scaled patterns use 256 levels of brightness.

Table 73. PGCFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	PATGEN_EXTCLK	R/W	0x0	Select External Clock Source: 1: Selects the external pixel clock when using internal timing. 0: Selects the internal divided clock when using internal timing This bit has no effect in external timing mode (PATGEN_TSEL = 0).
2	PATGEN_TSEL	R/W	0x0	Timing Select Control: 1: The Pattern Generator creates its own video timing as configured in the Pattern Generator Total Frame Size, Active Frame Size, Horizontal Sync Width, Vertical Sync Width, Horizontal Back Porch, Vertical Back Porch, and Sync Configuration registers. 0: the Pattern Generator uses external video timing from the pixel clock, Data Enable, Horizontal Sync, and Vertical Sync signals.
1	PATGEN_INV	R/W	0x0	Enable Inverted Color Patterns: 1: Invert the color output. 0: Do not invert the color output.
0	PATGEN_ASCRL	R/W	0x0	Auto-Scroll Enable: 1: The Pattern Generator will automatically move to the next enabled pattern after the number of frames specified in the Pattern Generator Frame Time (PGFT) register. 0: The Pattern Generator retains the current pattern.

7.7.1.63 PGIA Register (Address = 0x66) [reset = 0x0]

 PGIA is described in [Table 74](#).

 Return to [Summary Table](#).

Table 74. PGIA Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	PATGEN_IA	R/W	0x0	Indirect Address: This 8-bit field sets the indirect address for accesses to indirectly-mapped registers. It should be written prior to reading or writing the Pattern Generator Indirect Data register.

7.7.1.64 PGID Register (Address = 0x67) [reset = 0x0]

 PGID is described in [Table 75](#).

 Return to [Summary Table](#).

Table 75. PGID Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	PATGEN_ID	R/W	0x0	Indirect Data: When writing to indirect registers, this register contains the data to be written. When reading from indirect registers, this register contains the readback value.

7.7.1.65 PGDBG Register (Address = 0x68) [reset = 0x0]

 PGDBG is described in [Table 76](#).

 Return to [Summary Table](#).

Table 76. PGDBG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	RESERVED	R	0x0	Reserved
3	PATGEN_BIST_EN	R/W	0x0	Pattern Generator BIST Enable: Enables Pattern Generator in BIST mode. Pattern Generator will compare received video data with local generated pattern. Upstream device must be programmed to the same pattern.

Table 76. PGDBG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description

 RX_ID2 is described in [Table 82](#).

 Return to [Summary Table](#).

Table 82. RX_ID2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	RX_ID2	R	0x48	RX_ID2: 3rd byte of ID code. Value will be either 'B ' or 'H '. 'H ' indicates an HDCP capable device.

7.7.1.72 RX_ID3 Register (Address = 0xF3) [reset = 0x39]

 RX_ID3 is described in [Table 83](#).

 Return to [Summary Table](#).

Table 83. RX_ID3 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	RX_ID3	R	0x39	RX_ID3: 4th byte of ID code: '9 '

7.7.1.73 RX_ID4 Register (Address = 0xF4) [reset = 0x32]

 RX_ID4 is described in [Table 84](#).

 Return to [Summary Table](#).

Table 84. RX_ID4 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	RX_ID4	R	0x32	RX_ID4: 5th byte of ID code.

7.7.1.74 RX_ID5 Register (Address = 0xF5) [reset = 0x38]

 RX_ID5 is described in [Table 85](#).

 Return to [Summary Table](#).

Table 85. RX_ID5 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	RX_ID5	R	0x38	RX_ID5: 6th byte of ID code.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DS90UB948-Q1 is a FPD-Link III deserializer which, in conjunction with the DS90UB949/947-Q1 serializers, converts 1-lane or 2-lane FPD-Link III streams into a FPD-Link (OpenLDI) interface. The deserializer is capable of operating over cost-effective 50-Ω single-ended coaxial or 100-Ω differential shielded twisted-pair (STP) cables. It recovers the data from two FPD-Link III serial streams and translates it into dual pixel FPD-Link (data lanes + clock) supporting video resolutions up to WUXGA and 2K with 24-bit color depth. This provides a bridge between HDMI enabled sources such as GPUs to connect to existing LVDS displays or application processors.

8.2 Typical Applications

Bypass capacitors must be placed near the power supply pins. At a minimum, use four (4) 10-μF capacitors for local device bypassing. Ferrite beads are placed on the two sets of supply pins (VDD33 and VDDIO) for effective noise suppression. The interface to the graphics source is LVDS. The VDDIO pins may be connected to 3.3 V or 1.8 V. A capacitor and resistor are placed on the PDB pin to delay the enabling of the device until power is stable. See [图 47](#) for a typical STP connection diagram and [图 48](#) for a typical coax connection diagram.

Typical Applications (接下页)

DS90UB948-Q1

ZHCSSEN7B – OCTOBER 2014 – REVISED NOVEMBER 2018

www.ti.com.cn

图 49. Typical Display System Diagram

8.2.1 Design Requirements

For the typical design application, use the following as input parameters.

表 86. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
VDD33	3.3 V
VDDIO	1.8 or 3.3 V
VDD12	1.2 V
AC-coupling capacitor for STP with 925/927: RIN[1:0]±	100 nF
AC-coupling capacitor for STP with 929/947/949: RIN[1:0]±	33 nF - 100 nF
AC-coupling capacitor for Coax with 921: RIN[1:0]+	100 nF
AC-coupling capacitor for Coax with 921: RIN[1:0]-	47 nF
AC-coupling capacitor for Coax with 929/947/949: RIN[1:0]+	33 nF - 100 nF
AC-coupling capacitor for Coax with 929/947/949: RIN[1:0]+	15 nF - 47 nF

The SER/DES supports only AC-coupled interconnects through an integrated DC-balanced decoding scheme. External AC-coupling capacitors must be placed in series in the FPD-Link III signal path as shown in 图 50. For applications using single-ended 50-Ω coaxial cable, the unused data pins (RIN0- and RIN1-) must use a 15-nF to 47-nF capacitor and must be terminated with a 50-Ω resistor.

图 50. AC-Coupled Connection (STP)

图 51. AC-Coupled Connection (Coaxial)

For high-speed FPD-Link III transmissions, use the smallest available package for the AC-coupling capacitor. This minimizes degradation of signal quality due to package parasitics.

8.2.2 Detailed Design Procedure

8.2.2.1 FPD-Link III Interconnect Guidelines

See [AN-1108 Channel-Link PCB and Interconnect Design-In Guidelines](#) (SNLA008) and [AN-905 Transmission Line RAPIDESIGNER Operation and Application Guide](#) (SNLA035) for full details.

- Use 100-Ω coupled differential pairs
- Use the S/2S/3S rule in spacings
 - S = space between the pair
 - 2S = space between pairs
 - 3S = space to LVCMOS signal
- Minimize the number of Vias
- Maintain balance of the traces
- Minimize skew within the pair
- Terminate as close to the TX outputs and RX inputs as possible

Additional general guidance can be found in the [LVDS Owner's Manual](#) (SNLA187) available in PDF format from the Texas Instruments web site.

8.2.2.2 AV Mute Prevention

The "UH" Deserializers support AV MUTE functionality when receiving the specifically defined data pattern (0x666666) during the blanking period (DE = LOW). Once the device enters the AV MUTE state, the device mutes both audio and video outputs resulting in a black display screen.

Be advised if the video source continues sending random data during blanking interval, the DS90UB948-Q1 may inadvertently enter the AV MUTE state upon receiving random data matching the AV MUTE command pattern. When paired with a UB version FPD-Link compatible serializer, setting the gate DE Register 0x04[4] will prevent video signals from being sent during the blanking interval. This will ensure AV MUTE mode is not entered during normal operation. By default the Data Enable (DE) signal is assumed to be active high. If DE is active low, then setting DE_POLARITY register bit 0x12 bit[5] = 1 is also required. With the DE permanently LOW, deserializers do not check for the AV Mute conditions, so the AV Mute is not an issue when operating with HSYNC/VSNC only mode displays.

If unexpected AV MUTE state is seen, it is recommended to verify checking the data path control setting of the paired Serializer. This setting is not accessible from DS90UB948Q-Q1.

8.2.2.3 Prevention of I2C Errors During Abrupt System Faults

In rare instances, FPD-Link III bi-directional control channel data errors caused by system fault conditions (e.g. abrupt power downs of the remote serializer or cable disconnects) may result in the DS90UB948Q-Q1 sending inadvertent I2C transactions on the local I2C bus prior to determining loss of valid signal.

For minimizing impact of these types of events, TI suggests the following precautions:

- Set DS90UB948Q-Q1 register 0x04 = 0x02 to minimize the duration of inadvertent I2C events
- Ensure all I2C masters on the bus support multi-master arbitration
- Assign I2C addresses with more than a single bit set to 1 for all devices on the I2C bus
 - 0x6A, 0x7B, and 0x37 are examples of good choices for an I2C address
 - 0x40 and 0x20 are examples of bad choices for an I2C address

8.2.3 Application Curves

The plots below correspond to 1080p60 video application with a 2-lane FPD-Link III input and dual OpenLDI output.

图 52. Loop-Through CML Output at 2.6-Gbps Serial Line Rate

图 53. OpenLDI Clock and Data Output at 74.25-MHz Pixel Clock

9 Power Supply Recommendations

This device provides separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. provides guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter may be used to provide clean power to sensitive circuits such as PLLs.

9.1 Power-Up Requirements and PDB Pin

When power is applied, power from the highest voltage rail to the lowest voltage rail on any of the supply pins. For 3.3-V IO operation, VDDIO and VDD33 can be powered by the same supply and ramped simultaneously. Use a large capacitor on the PDB pin to ensure PDB arrives after all the supply pins have settled to the recommended operating voltage. When PDB pin is pulled up to VDD33, a 10-k Ω pullup and a > 10- μ F capacitor to GND are required to delay the PDB input signal rise. All inputs must not be driven until both VDD33 and VDDIO has reached steady state. Pins VDD33_A and VDD33_B must both be externally connected, bypassed, and driven to the same potential (they are not internally connected).

9.2 Power Sequence

^(*) It is recommended to assert PDB (active High) with a microcontroller rather than an RC filter network to help ensure proper sequencing of PDB pin after settling of power supplies.

图 54. Power Sequence

Power Sequence (接下页)
表 87. Power-Up Sequencing Constraints

	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
t_{r0}	VDD33 / VDDIO rise time	0.2			ms	@10/90%
t_{r1}	VDD12 rise time	0.05			ms	@10/90%
t_0	VDD33 to VDDIO delay	0			ms	
t_1	VDD33 / VDDIO to VDD12 delay	0			ms	
t_2	VDDx to PDB delay	0			ms	Release PDB after all supplies are up and stable.
t_3	PDB to I2C ready delay	2			ms	
t_4	PDB pulse width	2			ms	Hard reset
t_5	Valid data on RIN± to VDDx delay	0			ms	Provide valid data from a compatible Serializer before power-up . ⁽¹⁾
t_6	PDB to GPIO delay	2			ms	Keep GPIOs low or high until PDB is high.

- (1) Note that the DS90UB948Q-Q1 should be powered up after a compatible Serializer has started sending valid video data. If this condition is not satisfied, then a digital (software) reset or hard reset (toggling PDB pin) is required after receiving the input data. This requirement prevents the DS90UB948Q-Q1 from locking to any random or noise signal, ensures DS90UB948Q-Q1 has a deterministic startup behavior, specified lock time, and optimal adaptive equalizer setting.

10 Layout

10.1 Layout Guidelines

Circuit board layout and stack-up for the FPD-Link III devices must be designed to provide low-noise power feed to the device. Good layout practice also separates high frequency or high-level inputs and outputs to minimize unwanted stray noise pick-up, feedback, and interference. Power system performance may be greatly improved by using thin dielectrics (2 to 4 mils) for power/ground sandwiches. This arrangement provides plane capacitance for the PCB power system with low-inductance parasitics, which has proven especially effective at high frequencies, and makes the value and placement of external bypass capacitors less critical. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range of 0.01 μF to 0.1 μF . Ceramic capacitors may be in the 2.2- μF to 10- μF range. The voltage rating of the ceramic capacitors must be at least 5 $\times$ the power supply voltage being used.

TI recommends surface-mount capacitors due to their smaller parasitics. When using multiple capacitors per supply pin, place the smaller value closer to the pin. A large bulk capacitor is recommended at the point of power entry. This is typically in the 50- μF to 100- μF range, which smooths low frequency switching noise. TI recommends connecting power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane with via on both ends of the capacitor. Connecting power or ground pins to an external bypass capacitor increases the inductance of the path.

A small body size X7R chip capacitor, such as 0603 or 0402, is recommended for external bypass. The small body size reduces the parasitic inductance of the capacitor. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20 to 30 MHz. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also common practice to use two vias from power and ground pins to the planes to reduce the impedance at high frequency.

Some devices provide separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. Pin Description tables typically provide guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter may be used to provide clean power to sensitive circuits such as PLLs.

Locate LVCMOS signals away from the differential lines to prevent coupling from the LVCMOS lines to the differential lines. Differential impedance of 100 Ω are typically recommended for STP interconnect and single-ended impedance of 50 Ω for coaxial interconnect. The closely coupled lines help to ensure that coupled noise appears as common-mode and thus is rejected by the receivers. The tightly coupled lines also radiate less.

Information on the WQFN package is provided [AN-1187 Leadless Leadframe Package \(LLP\)](#) (SNOA401).

10.2 Ground

TI recommends that a consistent ground plane reference for the high-speed signals in the PCB design to provide the best image plane for signal traces running parallel to the plane. Connect the thermal pad of the device to this plane with vias.

At least 32 thermal vias are necessary from the device center DAP to the ground plane. They connect the device ground to the PCB ground plane, as well as conduct heat from the exposed pad of the package to the PCB ground plane. More information on the WQFN style package, including PCB design and manufacturing requirements, is provided in [AN-1187 Leadless Leadframe Package \(LLP\)](#) (SNLU165).

10.3 Routing FPD-Link III Signal Traces

Routing the FPD-Link III signal traces between the R_{IN} pins and the connector is the most critical pieces of a successful PCB layout. [Figure 56](#) shows an example PCB layout. For additional PCB layout details of the example, refer to the [DS90UH948-Q1EVM User's Guide](#) (SNLU162).

The following list provides essential recommendations for routing the FPD-Link III signal traces between the receiver input pins (R_{IN}) and the connector.

- The routing of the FPD-Link III traces may be all on the top layer or partially embedded in middle layers if EMI is a concern.
- The AC-coupling capacitors should be on the top layer and very close to the receiver input pins.

Routing FPD-Link III Signal Traces (接下页)

- Route the RIN traces between the AC-coupling capacitor and the connector as a 100- Ω differential micro-strip with tight impedance control ($\pm 10\%$). Calculate the proper width of the traces for a 100- Ω differential impedance based on the PCB stack-up.
- When choosing to implement a common mode choke for common mode noise reduction, minimize the effects of any impedance mismatch.
- Consult with connector manufacturer for optimized connector footprint. If the connector is mounted on the same side as the IC, minimize the impact of the thru-hole connector stubs by routing the high-speed signal traces on the opposite side of the connector mounting side.

10.4 Layout Example

Stencil parameters such as aperture area ratio and the fabrication process have a significant impact on paste deposition. Inspection of the stencil prior to placement of the WQFN package is highly recommended to improve board assembly yields. If the via and aperture openings are not carefully monitored, the solder may flow unevenly through the DAP. Stencil parameters for aperture opening and via locations are shown in 图 55:

表 88. No Pullback WQFN Stencil Aperture Summary

DEVICE	PIN COUNT	MKT DWG	PCB I/O Pad SIZE (mm)	PCB PITCH (mm)	PCB DAP SIZE(mm)	STENCIL I/O APERTURE (mm)	STENCIL DAP APERTURE (mm)	NUMBER OF DAP APERTURE OPENINGS	GAP BETWEEN DAP APERTURE (Dim A mm)
DS90UB948-Q1	64	NKD	0.25 × 0.6	0.5	7.2 × 7.2	0.25 × 0.6	1.16 × 1.16	25	0.2

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DS90UB948TNKDRQ1	ACTIVE	WQFN	NKD	64	2000	RoHS & Green	SN	Level-3-260C-168 HR	-40 to 105	90UB948Q1	Samples
DS90UB948TNKDTQ1	ACTIVE	WQFN	NKD	64	250	RoHS & Green	SN	Level-3-260C-168 HR	-40 to 105	90UB948Q1	Samples

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
